2026 Flexible Pavement  
Committee Meeting**

# HOT MIX ASPHALT - GENERAL CONSTRUCTION REQUIREMENTS – THICK LIFT (REV 1-11-22)

**AIEI**

ASPHALT | INNOVATE | ENLIGHTEN | IMPLEMENT

- Requires Central Office Authorization
- SP-12.5 & SP-19.0 asphalt mixes in lifts up to 6 inches thick
- Requires lifts greater than 4 inches to remain closed to traffic for 6 hours or surface & mid-depth falls below 160°F
- Requires mid-depth temperature monitoring approximately...

## HOT MIX ASPHALT - GENERAL CONSTRUCTION REQUIREMENTS – THICK LIFT (REV 1-11-22)

ARTICLE 330-10 is deleted and the following substituted:

### 330-10 Protection of Finished Surface.

Keep sections of newly compacted asphalt concrete, which are to be covered by additional courses, clean until the successive course is laid.

Do not dump embankment or base material directly on the pavement shoulders before placing the friction course on adjacent pavement.

Equip blade graders operating adjacent to the pavement during shoulder construction with a 2 inch by 8 inch or larger board, or other attachment providing clean results, attached to their blades so it extends below the blade edge and the surface from damage by the grader blade.

To prevent rutting or other distortion, protect sections of newly placed friction course and the last structural layer before friction course from traffic until temperature has cooled below 160°F.

For lifts of asphalt placed greater than 4 inches thick, protect from traffic for six hours or until the temperature on the surface and mid-depth has cooled below 160°F. Monitor the temperature of the center of the lift with a measuring device (thermocouple wire or probe) placed approximately 18 inches from the edge of the pavement inward toward the center of the mat. Make the width of the trench slightly wider than the temperature measuring device. Make the depth of the trench approximately one half the depth of the pavement layer. Insert the temperature measuring device into the trench. Begin compacting the mat after the temperature measuring device has been installed. Protect the newly finished layer for six hours if the temperature measuring device or is determined to be unreliable by the Engineer. Trim the thermocouple wire flush with the edge of pavement. Do not remove the thermocouple wire from the pavement. Remove the device if desired, without damaging the pavement.

The Contractor may use artificial methods to cool the pavement to expedite paving operations. The Department may direct the Contractor to use artificial cooling methods when maintenance of traffic requires opening the pavement to traffic at the earliest possible time.

## SUPERPAVE ASPHALT CONCRETE – THICK LIFT (REV 1-11-22)

SUBARTICLE 334-1.4 is deleted and the following substituted:

**334-1.4 Thickness:** The total thickness of the Type SP asphalt layers will be the plan thickness as shown in the Contract Documents. Before paving, propose a thickness for each individual layer meeting the requirements of this specification, which when combined with the layers (as applicable) will equal the plan thickness. For construction purposes, the

JUNE 2026

THICK LIFT  
ASPHALT PAVING SOLUTION

State Departments of Transportation (DOTs) are increasingly challenged to rehabilitate pavements more quickly while maintaining long-term performance and minimizing disruption to the traveling public. Thick lift paving, placing asphalt concrete (AC) layers significantly thicker than traditional lift thickness guidelines, is a practical strategy to address these pressures. By reducing the number of paving lifts, agencies shorten construction schedules, limit traffic disruption, and improve operational efficiency without compromising pavement performance.

Several state DOTs have explored and implemented thick lift paving through research and field projects. Full-scale evaluations, including sponsored sections at the National Center for Asphalt Technology (NCAT) Test Track, demonstrate that properly designed and constructed thick lifts achieve target in-place densities and perform well under heavy traffic. Field experience from multiple states confirms that thick lift paving is particularly effective in structural layers, deep mill-and-fill applications, and rapid rehabilitation projects where reducing closure time is critical.

Agency experience also highlights the importance of thoughtful implementation. Thermal management, paving effective practices, compaction practices, and surface preparation require careful attention, particularly when eliminating intermediate lifts that traditionally help refine smoothness.

**Spotlight:** Since 2015, the South Carolina DOT (SCDOT) has implemented thick lift asphalt on multiple major interstate reconstruction and widening projects. On its first large-scale application (I-85 in Spartanburg), crews placed more than 150,000 tons, including a 10-inch monolithic lift in the outside lanes. After a decade of service under heavy traffic, this project continues to perform satisfactorily.

Page 1 of 15

Figure 1. Driving Question.

Thick Lift Asphalt Paving offers a direct solution to the driving question posed in Figure 1 "How can we reconstruct our full-depth asphalt pavements in less time?" The following five primary benefits of thick lift asphalt paving represent the most significant drivers for agency adoption (Figure 2):

- Accelerated construction timelines.
- Enabled rapid full-depth reconstruction.
- Reduced interlayer bond issues.
- Extended the compaction window.
- Validated as a long-life solution.

**Defining Thick Lift:** Thick lift paving involves placing asphalt in a single layer significantly thicker than traditional limits. Lift thickness is commonly tied to the nominal maximum aggregate size (NMAS) of the asphalt mixture.

The National Asphalt Pavement Association (NAPA) *Mix Type Selection Guide* provides a general rule of thumb for fine-graded asphalt mixtures: the minimum lift thickness should be three times the NMAS (3×NMAS) of the mixture, while for coarse-graded mixtures it should be 4×NMAS. [1] The maximum lift thickness for traditional paving projects can be inferred from the *Guide* as four to five times the NMAS for fine-graded mixtures and five to six times the NMAS for coarse-graded mixtures. A notable

exception is the 4.75mm fine-graded mixture, which traditionally utilizes an 8×NMAS. (Table 1)

Figure 2. Primary Benefits of Thick Lift Asphalt Paving.

Table 1. NAPA Recommended Maximum Lift Thicknesses by NMAS for Traditional Paving Projects.

| NMAS |        | Fine-Graded Mixtures |       | Coarse-Graded Mixtures |       |
|------|--------|----------------------|-------|------------------------|-------|
| (mm) | (inch) | Upper (inch)         | Ratio | Upper (inch)           | Ratio |
| 4.75 | 0.19   | 1.5                  | 8.0   | —                      | —     |
| 9.5  | 0.37   | 2.0                  | 5.3   | —                      | —     |
| 12.5 | 0.5    | 2.5                  | 5.1   | 3.0                    | 6.1   |
| 19.0 | 0.75   | 3.5                  | 4.7   | 4.0                    | 5.3   |
| 25.0 | 1.0    | 4.0                  | 4.1   | 6.0                    | 6.1   |

— not applicable; Ratio = Upper Thickness / NMAS.

There is currently no universally accepted definition of what constitutes a "thick lift." In practice, the term refers to placement exceeding traditional NMAS-based thickness guidance. For thick lift paving, 12.5mm NMAS mixtures are commonly placed 5 to 8 inches thick, representing a ratio of 10× to 16× NMAS.

# How Thick is **Thick Lift**???

ASPHALT | INNOVATE | ENLIGHTEN | IMPLEMENT

- 
- There is currently no universally accepted definition of what constitutes a "thick lift."
  - In practice, the term refers to placement exceeding traditional NMAAS-based thickness guidance.
  - For example, 12.5mm NMAAS mixes are commonly placed 5 to 8 inches thick, or 10x to 16xNMAAS.

# TechBrief: Definition

ASPHALT | INNOVATE | ENLIGHTEN | IMPLEMENT

- 
- A young boy in a light blue polo shirt is standing in front of a dark green chalkboard. He is pointing his right index finger at a vertical scale of horizontal white lines drawn on the board. The scale consists of 12 lines of varying lengths, with the longest line in the middle and shorter lines above and below it, resembling a ruler or a measurement scale.
- Thick Lift is the placement of an asphalt mix at 8xNMAS or more.
  - E.g., 12.5mm → 4-inches or greater.

## **Accelerated Construction Timelines:**

Thick lift paving shortens project schedules by reducing the total number of paving cycles and limiting the time workers are exposed to and motorists are disrupted by traffic.

**Rapid Rebuild of Full-Depth Pavement:**  
Achieve the full required structural depth in a single placement, ideal for high-volume roadway reconstruction and emergency repairs. Particularly effective for deep mill-and-fill rehabilitation projects where reducing closure time is critical.

**Reduce Interlay Bond Issues:**  
**Eliminate intermediate lift interfaces that are sometimes susceptible to debonding or slippage. This removal of lift interfaces can improve the overall structural continuity of the pavement.**

# Tack Coat

Typical  
Application

Does this  
look okay?

**Extended Compaction Window:**  
**Increased thermal mass of thicker lifts allows the asphalt to retain heat significantly longer than conventional thin lifts. Especially beneficial in challenging environments with longer haul distances.**

# PaveCool App

What's the est

**Return to Existing Grade Each Shift: An operational advantage... return the lane to the existing grade within a single work shift. Eliminates the need for temporary transitions or multi-day lane closures in deep rehabilitation projects.**

**Easy To Compact: Thicker lifts improve compaction efficiency because internal confinement and extended heat retention allow aggregate particles to reorient more easily under rolling.**

**Rut Resistant: Demonstrated excellent rut resistance to heavy interstate traffic. When density targets are met, these pavements remain stable and perform consistently with design expectations.**

# What are the Benefits?

**Increased Lift Thickness and Production:**  
Significantly increases daily production rates and improves overall construction efficiency.

**Accomplish Work During the Winter Months:**  
The substantial heat retention of thick lifts, often with WMA, enables successful paving at temperatures as low as 30°F.

**No Special Equipment Required:**  
Successfully executed using conventional paving and rolling equipment already available to contractors.

**Validated Long-life Pavement!!!**
