WELCOME TO THE 2015 ANNUAL MEETING of the Biomedical Engineering Society! Our Annual Meeting is the premier event for the Society and the field of biomedical engineering. This year's theme – "Innovation at the Interface" – epitomizes the multidisciplinary approach of biomedical engineers. I urge you to take advantage of the excellent technical program, plenaries, special events and myriad opportunities for professional development and networking.

This year also marks the 25th Anniversary of the Society's Annual Meeting. It was a significant milestone: the Annual Meeting launched an upsurge of interest for both the Society and the general field of BME. Look for artifacts from the first meeting near the registration area and please join in commemorating the anniversary throughout the meeting.

This year features familiar networking opportunities including the Celebration of Minorities in BME Luncheon and the Women in BMES Luncheon. This year also includes new networking opportunities including the LGBT Dessert Social on Wednesday night. And don't miss the Friday Night Bash at the Convention Center where BEDrock will be performing – a band comprised of biomedical engineering faculty and colleagues.

This year's meeting also features a new slate of sessions from the Society's Industry Committee. The special sessions will take place throughout the meeting and will include: Transitioning from Academia to Industry; Engineering to Entrepreneur; and Start-ups and Venture Capital: Navigating the Funding Process and Investment Pitches. The Industry Committee has done a great job putting together the three days of programming, and I encourage you to take advantage of the sessions. These events promote BMES's vision to become the networking connection for academia and industry!

Student and Early Career programing has also been expanded for the 2015 meeting. The programing is specifically tailored for those navigating new careers. Topics include: How to Find a Job in Industry; How to get an Industry, Government or Academia job after your PhD; and Resume Review and Critique. The Annual Meeting Career Fair also returns this year on Friday from 1 pm to 5 pm.

Of special note, a terrific slate of keynote addresses starts Thursday morning with the Pritzker Distinguished Lecture by Martin Yarmush, MD, PhD, Rutgers University. And don't miss the special Friday night talk by Kevin Carroll, one of the researchers who helped develop a prosthetic tail for Winter the dolphin, whose story was featured in the movie *Dolphin Tale*.

In the 25-year history of the Annual Meeting, the Society has established itself as the premier organization for biomedical engineering and bioengineering. BMES has now grown to more than 7,000 members – up over 33% in just the past 4 years! The hard work of our members ensures that BMES will continue to lead the field. Special thanks are due to Conference Chair Steven C. George and Program Chair Angelique Louie, BMES Staff, NSF, NIH, our sponsors and our meeting attendees. My very best wishes to you for an enjoyable and productive meeting!

BMES
BIOMEDICAL ENGINEERING SOCIETY
Advancing Human Health and Well Being

A SHORT HISTORY OF THE FIRST STANDALONE BMES MEETING, OCTOBER 1990

THE FIRST PRACTITIONERS OF what became the discipline of biomedical engineering were systems physiologists and engineers, the latter largely trained in the traditional engineering disciplines. Both groups saw the value of more quantitative approaches to medicine and biology, and both were critically important to the creation of the BMES. However, each favored a different venue to present their work. Systems physiologists attended the Federation of American Societies for Experimental Biology (FASEB) annual meeting (since renamed "Experimental Biology") in the spring. BMES was a guest of the American Physiological Society at FASEB, where it held its annual business meeting. Most of the engineers who were to become active in BMES presented their work at the fall Annual Conference on Engineering in Medicine and Biology (ACEMB). Over time, BMES became a major contributor to the ACEMB program.

Although these meetings provided platforms for researchers in the emerging discipline of biomedical engineering, the presence of two venues, one more biologically oriented and the other with an engineering orientation, inhibited interaction between the two populations. Meanwhile, interdisciplinary competition in the engineering world during the 1980's compromised the financial viability of the ACEMB, the last of which was held in 1988. It became clear that the impending loss of a platform for a growing number of interdisciplinary engineers, and the unhelpful distinction between engineers and quantitative physiologists, could both be addressed if BMES took the lead and ran a meeting that would welcome both populations. Furthermore, such a meeting would establish the Society as the society for all biomedical engineers and, in the longer term, establish by example biomedical engineering as a distinct discipline within engineering (see accompanying rationale).

The BMES President in 1988-9 (terms were for a single year at that time) was Mort Friedman, who created a Special Committee to explore the possibility that our Society could independently manage a technical meeting, distinct from FASEB, that would underline the broader aspects of our field. The committee met at the final ACEMB and was chaired by President-Elect H.K. Chang. In January 1989, the Special Committee filed a report recommending that BMES go forward with its first Annual Fall Meeting. As President of BMES from 1989-90, H.K. advanced the process in an important way by obtaining an essential grant from the Whitaker Foundation. The President of our Society in 1990-1 was Dan Schneck, who took the process the rest of the way, serving as Conference Chair of the first standalone meeting of BMES, in Blacksburg, Virginia, in October 1990.

CETACEANS. SEA. SCIENCE. We are excited to welcome you to the 2015 BMES meeting in Tampa, Florida!

This year's theme is Innovating at the Interface, which celebrates the highly interdisciplinary and collaborative nature of biomedical engineering. To highlight these types of interactions, in this year's program you will see the denotation "DREAM TEAM & CENTER" and Centers" next to some of the abstracts. These are works that self-identified to consist of teams of three or more principal investigators/labs working in collaboration. Although we are highlighting teams of >3 PIs, many other works presented may consist of collaborations between 2 PIs. Celebrate the strength of team-work by making note of successful collaborations and think about how you could enhance your own work through fruitful alliances.

As befitting the sunshine state, the program this year is full of bright gems. We have two fascinating Plenary Sessions: The Thursday night Plenary features three representatives from major funding agencies (NSF, NIH, Stand Up to Cancer) speaking on the future of funding. Come hear about these different funding models and where the leadership sees trends going in the future. Stand Up to Cancer is a relatively new funding agency with a unique funding model that focuses on "DREAM TEAM & CENTER". Come to the plenary to find out more about it! Friday night we have a special treat with speaker Kevin Carroll, engineer of the prosthetic fin worn by Winter the dolphin. Winter lost her tail fin when she was entangled in a crab trap line at only 3 months old. Though her tail had to be amputated, she was able to swim again with the aid of a prosthetic tail. Hear Dr. Carroll speak about advancement in human rehabilitation engineering as well as how these advancements can aid other species.

You will also see several technical sessions that are jointly listed between Tracks in the Program-at-a-Glance (beginning page 229) in order to highlight and promote the cross-disciplinary nature of research.

There are several new features to this years meeting. First, this year in the Exhibit Hall is the "Meet the Expert" theater. Throughout the meeting, experts from various disciplines and careers will be featured, who will give a more in depth view of a variety of BME topics and potential career paths. Programming for the theater can be found on page 74 and 132. Drop by and meet an expert! Second, there are cash awards for the winners of the "Best Poster" competition. This year there will be five awards, and in addition to the cash award, each winner will receive a certificate and recognition on the BMES website. Third, we are having a series of "Student and Early Career" sessions that will cover a range of topics from how to get your first job in industry to protecting intellectual property. And, of course, don't forget the BMES BASH on Friday evening.

This meeting also would not be possible without your participation. There were a record-breaking 2,885 abstract submissions this year. The efforts and dedication of our many volunteers are truly appreciated. From the Track Chairs, Abstract Reviewers/Session Chairs to the student volunteers at the meeting, it takes a village and we want to take this moment to acknowledge all of the volunteers—be sure to thank one when you see them around the meeting!

Emerging Technologies and Biomedical Engineering Innovation

THIS PRESENTATION WILL COVER a diverse set of key topics that have the potential to make a real difference in biomedical research and healthcare in the coming decades. The discussion of certain "hot" fields (e.g. organs-on-a-chip, stem cells, tissue engineering, synthetic biology, personalized medicine, nanobiotechnology, etc.) will attempt to distinguish between what will likely be within the realm of scientific advancement and technology development, and not merely fodder for "scientific entertainment.

Martin L. Yarmush is an internationally recognized bioengineer and translational scientist whose laboratory has been a pioneer and leader in multiple fields including: tissue engineering and regenerative medicine, applied immunology and biotechnology, BioMEMS and nanotechnology, and metabolic engineering and functional genomics. Dr. Yarmush currently serves as the Paul and Mary Monroe Chair and Distinguished Professor of Biomedical Engineering at Rutgers University, and Director of the Center for Engineering in Medicine at the Massachusetts General Hospital/Harvard Medical School. Over the last 30 years, Dr. Yarmush has: 1) published more than 450 peer-reviewed journal articles, 2) has co-authored more than 50 patents and patent applications, 3) has mentored over 130 postdoctoral fellows and graduate students, and 4) has taught a spectrum of courses from Molecular Genetics and Immunology, to Thermodynamics and Transport Phenomena, to Innovation and Entrepreneurship for Science and Technology and Bioengineering in the Biotechnology and Pharmaceutical Industries. More than 70 of his former fellows have gone on to successful careers in academia both here and abroad, while many others have gone on to become leaders in the pharmaceutical, biotechnology and medical device industries. In addition to his teaching and research achievements, Dr. Yarmush has contributed to the advancement of science and engineering through service as: (1) a member of NIH, NSF, FDA, and Office of Technology Assessment review panels; (2) an advisory board member for foundations (e.g. the Whitaker Foundation, Juvenile Diabetes Foundation, and Doris Duke Foundation), academic-based centers, and industrial firms; and 3) an editor of several science and engineering journals. A frequent invited speaker at major conferences and institutions, and winner of over 25 local and national awards, Dr. Yarmush's research "pushes the envelope" on several healthcare technology frontiers. He has been credited with many pioneering scientific and technological advances including: innovative cell culture systems, stem cell therapies, dynamic cell and tissue microsystems, point-of-care devices, bioartificial organs development, targeted therapies for tumors and infections, recombinant protein purification techniques, and recombinant retrovirus production and purification techniques. Some of these developments have resulted in licensed patents and the formation and development of > 10 companies based on these advances. Dr. Yarmush received his BA from Yeshiva University, his MD degree from Yale University, and completed PhD work at The Rockefeller University in biophysical chemistry and at MIT in chemical engineering.

Advances in Biomechanical Simulation of Complex Hand Motion

PERSONS WITH RECENT HAND amputations expect modern hand prostheses to function like intact hands. Because of this, advances in mechanical hardware are directed toward providing functionality comparable to the intact human hand. Despite such advances, the performance of sophisticated hand prostheses remains limited by the ability to control them via physiological (e.g., electromyographic) signals sensed from the user.

Currently, my laboratory leads a NIBIB-funded study with the long-term objective of advancing biomechanical simulation of the hand and wrist in order to facilitate control algorithms capable of predicting the motions that would occur in an intact hand given the electromyographic (EMG) signals measured from the residual muscles of an amputee's forearm. Given the paucity of experimental data describing complex hand motions, in general, we first developed experimental protocols that enabled .

Dr. Murray is an Associate Professor at Northwestern University with appointments in the Departments of Biomedical Engineering, Physical Medicine and Rehabilitation, and Physical Therapy and Human Movement Sciences. She is the Director of the Applied Research in Musculoskeletal Simulation (ARMS) laboratory at the Rehabilitation Institute of Chicago, where she is appointed as a Research Scientist; she also holds an appointment as a Research Health Scientist at the Edward Hines VA Medical Center. Dr. Murray received her Bachelor of Science in Mathematics from the University of Notre Dame in 1990. She obtained her M.S. and Ph.D. in Biomedical Engineering from Northwestern University. She completed post-doctoral training in Biomedical Engineering at the Cleveland FES Center at Case Western Reserve University, where she was named an NIDRR Mary Switzer Fellow, and was also awarded post-doctoral funding from the Paralyzed Veterans of America. From 2000 to 2006, she developed an NIH-funded research program as an independent investigator for the Department of Veterans Affairs at the VA Palo Alto. She joined the Northwestern faculty in 2007.

The foundation for Dr. Murray's work is the development of biomechanical models that accurately represent the mechanical actions of the upper extremity muscles. The models and corresponding anatomical databases that Dr. Murray has shared with the scientific community have been cited hundreds of times. The main thrust of her current research is the application of these models to better understand and, ultimately, to help improve function of the disabled upper limb. Her work has relevance over a broad scope, including basic motor control, the design of control systems for exoskeletons and upper limb prosthetics, restoration of hand and arm function following cervical spinal cord injury, rehabilitation of hand and arm function following stroke, orthopaedic interventions for osteoarthritis, and prevention of injuries in baseball pitching. In addition to the NIH and VA investigator-initiated award funding that has enabled her research program to thrive, the trainees in her program have been awarded pre- and post-doctoral fellowships from NIH, the Neilsen Foundation, and the American Heart Association. She served as co-Track Chair of the Orthopaedics and Rehabilitation Engineering Track at the 2014 Biomedical Engineering Society Annual Meeting, and Program Chair of the 2011 Annual Meeting of the American Society of Biomechanics. She is a member-at-large of the Executive Board of the US National Committee on Biomechanics and is also a member of the Multi-Scale Modeling Consortium, sponsored by the Interagency Modeling and Analysis Group.

Engineering Self-Assembled Porphyrin Nanoparticles for Biomedical Applications in Imaging and Drug Delivery

PORPHYRINS HAVE PLAYED NUMEROUS historic roles in development of approaches to the diagnosis and treatment of diseases, in particular based on how these molecules interact with light. This lecture will cover some of our recent efforts to develop new self-assembled materials from porphyrins and related molecules and how these nanomaterials have potentially advantageous properties for disease diagnosis and therapy. In particular, several recently reported nanoscale systems will be discussed that are being investigated preclincally: First, porphyrin nanovesicles have been developed that can release drugs in response to red laser irradiation, leading to enhanced drug deposition in irradiated tumors. Second, these porphyrin nanovesicles can be chelated with cobalt for simple functionalization using polyhistidine ligands. Finally, a family of highly light-absorbing nanoparticles have been developed for safe and real-time gastrointestinal imaging following oral administration.

JONATHAN F. LOVELL is an assistant professor of biomedical engineering at the State University of New York at Buffalo. He is a faculty of both the School of Engineering and Applied Sciences, and the School of Medicine and Biomedical Sciences. Dr. Lovell received a Bachelor of Applied Sciences in Systems Design Engineering from the University of Waterloo in 2004. He went on to a M.S. degree in Biochemistry at McMaster University working in the group of Dr. David Andrews where he developed liposomal systems to study membrane permeabilization during cell death. Dr. Lovell pursued doctoral studies in biomedical engineering at the Institute of Biomaterials and Biomedical Engineering at University of Toronto. Working under Dr. Gang Zheng, Dr. Lovell discovered new liposome-like nanovesicles formed from porphyrin-phospholipids conjugates, which exhibit unique characteristics useful for biomedical imaging and therapy. In 2012, Dr. Lovell received his Ph.D. and joined the University at Buffalo faculty the same year. In 2013, Dr. Lovell was awarded an Early Independence Award from the National Institutes of Health. To date, he has co-authored over 40 peer-reviewed journal publications and 7 patents. His group at University at Buffalo has published numerous works involving the engineering of porphyrin-based materials, in journals including Advanced Materials, Nature Chemistry, Nature Communications and Nature Nanotechnology. Dr. Lovell is a council member and newsletter editor for the American Society for Photobiology, and is a member of the American Chemical Society as well as BMES. Dr. Lovell is on the editorial board of several journals including Theranostics and is a senior editor for the Journal of Interdisciplinary Nanomedicine. He has participated in numerous federal and international grant review panels. His main research interests involve developing clinically translatable nanoplatforms for improving disease diagnosis and treatment.

BMES established this award in 2000 to honor Rita M. Schaffer, former BMES Executive Director. Rita's gift of her estate, along with contributions from her family, friends, and associates, has enabled BMES to create the Rita Schaffer Young Investigator Award, which includes the Rita Schaffer Memorial Lecture.

Biomedical Engineering at The City College of New York: Experiences in Diversity and Success

THE DEPARTMENT OF BIOMEDICAL ENGINEERING at The City College of New York was created in 2002 with a mission that placed equal emphasis on academic excellence and diversity. We are uniquely positioned for this mission, given the rich legacy of City College and its historical core commitments to offer an affordable education and to recruit and support a diverse student population, reflective of both New York City and the global society in which we live. We will discuss our approaches, failures and successes en route to achieving a faculty and student body diversity that is extraordinary among engineering programs in the United States.

DEPARTMENT OF BIOMEDICAL ENGINEERING AT THE CITY COLLEGE OF NEW YORK

Founded originally in 1847 as the Free Academy of the City of New York, the mission of The City College of New York (CCNY) was and remains: "To provide the children of immigrants and the poor access to free higher education based on academic merit alone." The CCNY Department of Biomedical Engineering has 13 faculty members, with research concentrations in Cardiovascular Biomechanics, Musculoskeletal Biomechanics, Neural Engineering and Tissue Engineering & Biomaterials. Among our faculty are members of the National Academy of Engineering, National Academy of Sciences, Institute of Medicine and 8 Fellows of the American Institute of Medical and Biological Engineering. We are also among the most diverse faculties in the country; 7 of our 12 faculty are women and/or under-represented minorities.

Education: The PhD program in Biomedical Engineering at CCNY started in 1999. In the most recent NRC Rankings of PhD programs, it was ranked 1st in diversity, 7th in overall research productivity and among the top 20 programs in overall quality. Our undergraduate program started in 2006 and has rapidly grown into one of the most successful in the NYC area. True to our CCNY mission, diversity and outreach remain our priority. **The New York Center for Biomedical Engineering (NYCBE)** The CCNY Department of Biomedical Engineering also anchors the NYCBE - a consortium established in 1994 to serve as a center for promoting interactions between CCNY and partner clinical institutions in NYC (Albert Einstein College of Medicine, Hospital for Special Surgery, Weill Medical College of Cornell University, Mount Sinai School of Medicine, New York University Schools of Medicine and Dentistry, Memorial Sloan-Kettering Cancer Center, CUNY School of Medicine). The NYCBE enables research and educational collaborations, program and training grants, and provides opportunities for CCNY BME students in research laboratories at partner institutions.

Leveraged Innovation: Incorporating, New Opportunities, Varying Tactics, Opposing the Norm!

Christine S. Grant, PhD, Associate Dean of Faculty Affairs and Professor of Chemical and Biomolecular Engineering at North Carolina State University

In this presentation, Dr. Grant will share her experiential perspectives in engineering and inspire the audience to: (i) identify the interfaces in their lives, specifically at the intersection of the personal and professional realms, (ii) create exemplar examples of people and systems that manage seemingly conflicting realms well, and (iii) execute a plan aligned with their own life goals. The discussion will include strategic approaches to the myriad interfaces that exist in the professional and personal realms. The resulting plan will be both flexible and incorporate paradigm-shifting opportunities for "career upgrades." The balance between the public and private components of this plan enables us to selectively invite allies to successfully leverage our core strengths with their external networks, creating new pathways for success.

Dr. Christine Grant is a tenured Full Professor of Chemical and Biomolecular (CBE) engineering and serves as the Associate Dean of Faculty Advancement in the NC State College of Engineering. She is one of only 4 African-American women ChE Full Professors in the U.S. Grant is working to change the under-representation of women and minorities in STEM through targeted empowerment of both women and underrepresented minority (URM) academics at all levels in the STEM pathway. An NSF Presidential Award for Excellence in Science, Math and Engineering Mentoring (PAESMEM) awardee, Grant was selected as a Boeing Senior Fellow of the National Academy of Engineering's Center for the Advancement of Scholarship on Engineering Education (CASEE). She has received the AIChE Minority Affairs Committee Distinguished Service Award, Council for Chemical Research Diversity Award, and YWCA Academy of Women in Science and Technology award. An entrepreneur, her company, Leveraged Empowerment a unit of CoolSci Productions LLC empowers STEM students, faculty and professionals towards excellence in both academic career and personal development via workshops, keynotes and seminars.

The mentor will help students incorporate key design considerations, including (i) market considerations for commercialization, (ii) design development and testing, (iii) quality control, (iv) regulatory strategy, and (v) intellectual property protection. After the workshop, students will meet virtually (e.g., via Skype) for up to 6 months to further refine their innovation. They will also be required to produce a more extensive presentation of their product, such as a video for a Kickstarter campaign, or a PowerPoint presentation for a group of potential investors. We will alert participants about opportunities for design contests, investment, and grant programs to further promote and develop their innovations.

Alpha Eta Mu Beta Annual Ethics Session - Genomic Testing and Personalized Medicine, to What Extent is Knowing a Good Thing?

Friday, October 9
2:00pm - 3:00pm
Convention Center, Room 25

Session Chair: Robert D. Frisina, PhD, Bhavit Vora, BS

Today's biomedical engineers are advancing many technical areas of bioengineering at a very rapid pace. Impacts of recent and ongoing advances in tissue engineering and microelectronic fabrication are revolutionizing progress in the arenas of personalized medicine, especially with regards to molecular genetics and genomic testing. Technological progress in these areas have significantly improved quality of care and the efficacy of treatment. However, one of the professional conundrums in the area of genomic testing pertains to moral and ethical challenges, especially with regards to newborns and children. The basic dilemma here focuses upon the decisions that parents have to make for their young children, since children cannot make the decision themselves, about how much genetic testing should be carried out, and what can or should be done with the results of that genetic testing. Genomic testing in children is becoming faster, more efficient and less expensive. So, now instead of testing for a few obvious genes for children who are born with birth defects, possible genetic syndromes, or easily diagnosed problems such as hearing loss or deafness, genetic screening immediately on the horizon will be able to screen for mutations in hundreds or thousands of genes routinely. So, for example, what if a newborn is discovered to have a gene that causes an age-related disorder such as Alzheimer's Disease? Should the parents be told? Should the child be told when they are old enough to know? What is the point of telling the family now, when there are still no preventative or curative treatments of Alzheimer's? Should it go in the child's medical record, where future employers, insurance companies or hackers can gain access to it? And you can imagine a number of biomedical scenarios where it is not obvious what to do with genetic information such as this. Another

challenging issue is how to obtain the necessary blood samples from a newborn, which has a relatively small blood volume. Umbilical cord blood has been mentioned as a good source, since the umbilical cord is normally cut (sometimes by the proud Father) and discarded with the placenta. However, even this seemingly innocent, harmless procedure has now been called into question as some new evidence suggests that babies do better when the cord blood is allowed to flow into the baby for awhile, precluding a quick cutting of the cord, as has traditionally been done. So, as biomedical engineers work with nurses, doctors, insurance companies and other players in our healthcare system, these issues will come up without clear-cut answers available to them.

Alpha Eta Mu Beta (AEMB), the International Biomedical Engineering Honor Society, is committed to promoting ethics in the field of biomedical engineering. This year, AEMB is honored to host Dr. Robert D. Frisina. Dr. Frisina is a Professor and Director of the Department of Chemical and Biomedical Engineering and also the director for the Communication Sciences and Disorders lab at the University of South Florida. In addition, Dr. Frisina is the director of the Global Center for Hearing and Speech Research and holds joint appointments as Professor at the National Technical Institute for the Deaf (one of two colleges for the deaf in the world), and at the University of Buffalo Center for Hearing and Deafness. Dr. Frisina's research is focused on the function and disorders of the auditory system, more specifically in the critical areas of hearing loss and deadness for which there are is no existing cure. More information about Dr. Frisina can be found at his official website (http://www.eng.usf.edu/~rfrisina/).

Whitaker International Program: Funding Opportunity for Young Biomedical Engineers

Friday, October 9

8:00am - 9:30am

Convention Center, Room 39

The Whitaker International Program, founded in 2005 provides funding to emerging U.S.-based leaders in biomedical engineering to conduct a study and/or research project, with the underlying objective of building international bridges. Grant projects – including research, coursework, public policy work – are intended to enhance both the recipient's career and the BME field. The goal of the Whitaker Program is to assist the development of professional leaders who are not only superb scientists, but who will advance the profession through an international outlook. The Whitaker Program has two subprograms: Fellows and Scholars Program, and the Summer Program. SPECIAL SESSION

Meet the Expert 2015 Schedule

New for 2015 is the "Meet the Expert" theater located on the Exhibition Hall floor. "Meet the Expert" was conceived as a method to allow attendees to explore various biomedical engineering disciplines and career options. The format of the theater allows closer interaction and personal connection with invited experts who will be presenting throughout the week.

Thusday, October 8

12:30 - 1:45PM
Engineer/Clinician to Entrepreneur
Samit Gupta[1], Paul Torres[2]

[1]Graftworx, [2]Universal Hospital Services

Description: The audience will be treated to an inside look of medical device entrepreneurship. The challenges and triumphs of entrepreneurship will be explained with real-world experiences from an engineer or clinician who launched a successful start-up. The speaker will be available for a Q&A session after the presentation.

2:00 - 3:30PM
Product Development Panel: From Idea to Product
Rebecca DeLegge[1], Stuart Hart[2], Anthony Coston[3], Elliot Botvinick4

[1]DeLegge Medical, [2]Center for Advanced Learning and Simulation (CAMLS), [3]Alkermes, [4]UC Irvine

Description:This session will provide an overview of the medical device development process. Join experts in medical device product development as they discuss aspects of the development process from idea to commercialization. They will share perspectives on product development relevant to start-ups (including university and clinician inventors) and large medical device manufacturers.

4:30 - 6:00 PM
Opportunity Recognition at the Interface of Medicine and Technology
Rashid Bashir[1], Amy Herr[2], Elliot Botvinick[3]

[1]Univ of Illinois at Urbana-Champaign, [2]UC Berkeley, [3]UC Irvine

Description: An in-depth look into what it takes to commercialize cutting edge technologies from academic labs through successful startups and spinoffs in medicine and healthcare. Meet entrepreneurs from academia and industry who worked on both sides of the equation, and learn how they identified the right opportunities and the right approaches for successful commercialization.

SPECIAL SESSION

2:00 PM - 4:00 PM - Ballroom BC

Biomedical Engineering Technology for the Elimination of Health Disparities

Chairs: Gilda Barabino, Cato Laurencin.

This session will explore the role of biomedical engineering for use in addressing health disparities. The use of technologies for addressing musculoskeletal conditions such as arthritis and osteoporosis will be explored. New emerging technologies involving mobile health (m-health) present possibilities for treatment of diabetes and hypertension. Whitaker International Program: Funding Opportunity for Young Biomedical Engineers

The Whitaker International Program, founded in 2005 provides funding to emerging U.S.-based leaders in biomedical engineering to conduct a study and/or research project, with the underlying objective of building international bridges. Grant projects – including research, coursework, public policy work – are intended to enhance both the recipient's career and the BME field. The goal of the Whitaker Program is to assist the development of professional leaders who are not only superb scientists, but who will advance the profession through an international outlook. The Whitaker Program has two sub-programs: Fellows and Scholars Program, and the Summer Program. For more information, including program details, the online application and deadlines, visit: http://www.whitaker.org.

SPECIAL SESSION

1:45 PM - 5:00 PM - Ballroom A

BMES-NSF Special Session on Research in BME & Grant Writing

Pre-registration required

BMES and the National Science Foundation (NSF) will convene a special session focused on innovative research in biomedical engineering and grant writing. The session will bring together NSF Bioengineering and Engineering Healthcare grantees, young investigators, junior and senior faculty, post-doctoral fellows and graduate students for idea exchange and networking related to conducting and funding cutting-edge research in BME. The session will showcase NSF funded research and researchers, foster collaboration and idea exchange, familiarize participants with NSF funding mechanisms, and provide strategies for preparing competitive grant proposals. The research areas where the NSF Biomedical Engineering Program supports fundamental and transformative research will also be discussed. Participants at all levels will gain an increased awareness of NSF funded research, a better understanding of NSF funding opportunities and how to prepare successful grant applications, and a chance to establish new relationships leading to future collaborations. This material is based upon work supported by the National Science Foundation under Grant No. CBET –1540059.
