BIOMEDICAL ENGINEERING SOCIETY™

How to Prepare an Effective Poster Presentation

February 27, 2013
3:00 PM ET

Announcements

- ▶ Presentation slides and archived audio recording will be available a few days after the webinar at: <http://bmes.org/elearning>
- ▶ You may submit questions throughout by using the online chat function
- ▶ Questions will be addressed at the end
- ▶ Please take a few minutes to complete the brief survey following the webinar to provide feedback

Polling Questions

- Which of the following best describes you?
 - Undergraduate student
 - Graduate student
 - Early career professional
 - Faculty
 - Other
- Have you ever presented a poster before?
 - Yes
 - No

BMES webinar #1:

How to Prepare an Effective Poster Presentation

Part I: anatomy of a poster

Kristen L. Billiar, Ph.D.

Worcester Polytechnic Institute

kbilliar@wpi.edu

Anatomy: the nuts and bolts

1. Assess – audience and your motivation
2. Assemble content
 - like any presentation or paper
3. Organize your information - simplify
 - Identify important message, supporting info
 - Develop flow, minimize text
4. Design visuals
 - Text types and sizes
 - Do's and don'ts for graphics
5. Assemble the poster
 - General best practices

Assess... to guide decisions

Focus of Part 2

- Target audience and time they'll spend?
 - Lay person?
 - Scholar from a your field or different field?
 - Student paper competition?

<http://bmes.org/>

Assess... to guide decisions

Focus of Part 2

- Target audience and time they'll spend?
 - Lay person?
 - Scholar from a your field or different field?
 - Student paper competition?
- Your motivation?
 - Inform?
 - Persuade?
 - Establish yourself or compete?

Assemble content

- Effective title - professional tone
- List coauthors & institutional affiliations (w/logos)
- Abstract – optional (next slide)
- Introduction - background and goal (highlighted)
- Materials & Methods
- Results – quantitative and qualitative - graphical
- Discussion, conclusions, future
- Acknowledgments (esp. funding)
- References – can use abridged style

Abstract (optional)

1. Significance and scope of broader problem
2. Gap in knowledge
3. Your specific goal/hypothesis (to fill gap)
4. Methods used (general approach/synopsis)
5. Qualitative & quantitative results (ranges and/or mean \pm SD, stats if possible)
6. Discussion with comparison with literature and short conclusion (don't forget concl)

Organize info - simplify

- Space is limited, what's **most** important?
 - It's a presentation – not stand alone document
- Take-away message
 - **One** core idea - Not details
 - Key supporting information?

WPI Main title: Subtitle
Names
Affiliations

Abstract (optional)
Short abstract <200 words (if req):
- Significance and scope of reader problem (if req)
- Gap in knowledge (if req)
- Your specific goal
- Methods used (synopsis, no refs here)
- Quantitative and qualitative results (with ranges of numerical values)
- Discussion and comparison with literature and short conclusion (if req here)
- View diagram/schematic of how research relates (if possible)
- This can be bulleted, or can be one short paragraph (only place on poster where a paragraph is recommended)

Introduction/Background
Background (if req) starts with citations to the literature
- Literature review (optional)
- Rationale for study

Methods
- Specific methods with rationale for model, reagents, and materials used for each here – see choices above!
- Gap by exp. list, reagents, validated hypothesis!
- Schematic (e.g., flowchart, word/idea, photo of representative sample)
- Detailed equations with equation numbers and defined variables
- Assumptions stated

Results with figures and tables
- Bulleted lists
- Qualitative description (no paragraph/bulleted) – mode of failure, picture of failed sample
- Representative plots (use large enough font to see from 2 ft away)
- Table headings above tables
- Watch your sig figs, give average, SD, etc. R² or p-value for statistics
- Don't "data dump" all of your data on the audience
- Describe a figure captions below, can use numbers or not, your choice

Summary
You don't need a summary box (could have a section here)

Conclusions and Future
Bulleted list of conclusions with citations to the literature
- Did you meet your goal? How can you back that up?
- Do your values make sense (labels needed to the literature)
- What are the limitations? (e.g., model)
- Make some real conclusions based on your data – can't hide behind "variability" – you should do enough samples to be sure of your conclusion

Acknowledgements
Special thanks to ???. Make sure you acknowledge funding sources.

References
1. Numbered list of references, or author (date) for things that are common knowledge – everything you don't know when you started the project.
2. Depending upon rules for conference presentation, you can probably use an abbreviated list of references, e.g., "1" author than et al. If more than 2 authors, leave out paper title, etc.

Core take away idea

Organize info - simplify

- Space is limited, what's **most** important?
 - It's a presentation – not stand alone document
- Take-away message
 - **One** core idea - Not details
 - Key supporting information?
- Bullets, no paragraphs
 - shoot for 7 entries max
 - group concepts
- Visual flow
 - Direct the reader - left-right, arrows, and/or numbers
 - Start with 3 columns, but don't be constrained

The slide layout template consists of 7 columns and several sections. The sections are:

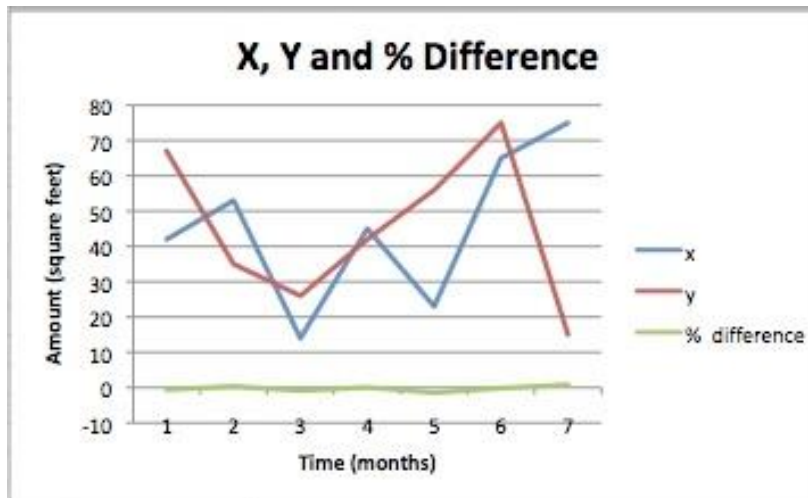

- Abstract (optional)**: Short abstract (<math>< 200</math> words) with significance and scope of broader problem, your specific goal, methods used, quantitative results, and a conclusion.
- Introduction/Background**: Background information, literature cited, and rationale.
- Methods**: Specific methods with rationale, choice of data, schematic diagrams, and data presentation.
- Results with figures and tables**: Bulleted list of qualitative descriptions, quantitative results, and a table of data.
- Summary**: A concise summary of the key findings.
- Conclusion and Future**: Conclusions drawn from the results and future work.
- Acknowledgments**: Recognition of those who assisted in the work.
- References**: A list of sources consulted.

 Green arrows indicate a flow from left to right across the top row (Abstract, Results, Summary), then down to the bottom row (Introduction, Methods, Conclusion), and finally across the bottom row. A large green arrow at the bottom right points upwards and to the right, labeled 'Core take away idea'.

Design visuals – do's and don'ts

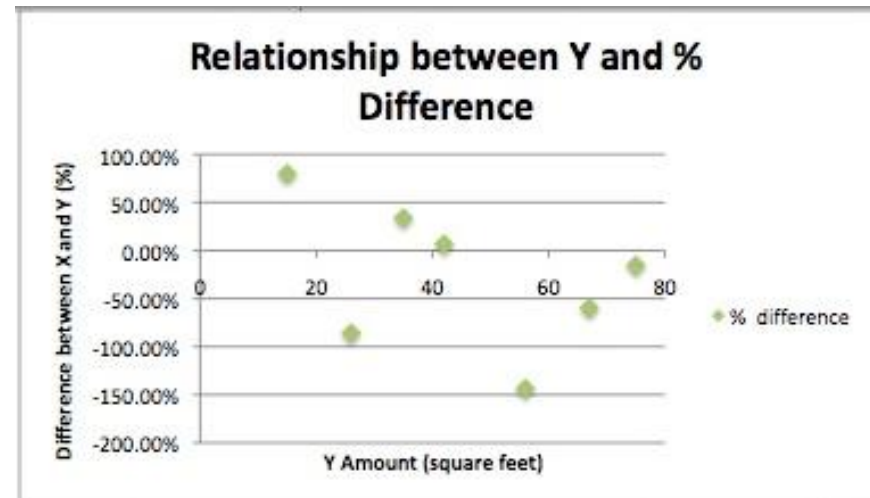

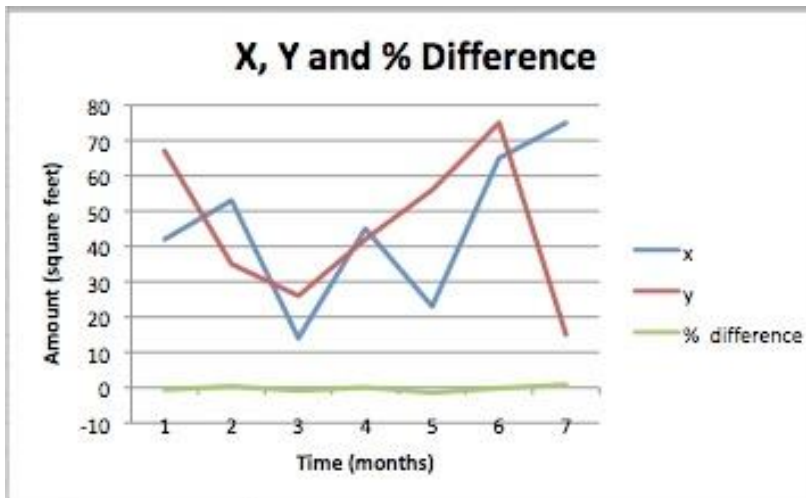

- Less text, more figures
 - Images, charts, graphs, timelines, and diagrams
 - Avoid tables (graph the data)

Design visuals – do's and don'ts

- Less text, more figures
 - Images, charts, graphs, timelines, and diagrams
 - Avoid tables (graph the data)

utexas.edu/ugs/our/poster/create_message/design

- Use consistent colors (as above, but need contrast)
- Caption below, not titles (NOT as above)
- Cross lines only when necessary, sig figs!

Sig figs

- Use proper significant figures
- Highlight important comparisons - differences, changes, and trends – not specific numbers

Design visuals – specifics

- Entering graphs/plots
 - I generally paste picture (JPG or PNG, not TIFF) from Excel or similar - avoids resizing issues and linked files
 - No background instead of white

Design visuals – specifics

- Entering graphs/plots
 - I generally paste picture (JPG or PNG, not TIFF) from Excel or similar - avoids resizing issues and linked files
 - No background instead of white
- Photos
 - 150 dpi (or even 300 dpi)
 - or line art/emf

Axes and fonts

Image Source: XKCD

Axes and fonts

Image Source: XKCD

- Use proper axes
- Use large enough font to see from 3 feet
- Sans serif (Arial) rather than serif (Times)
- Comedy only if relevant...

B

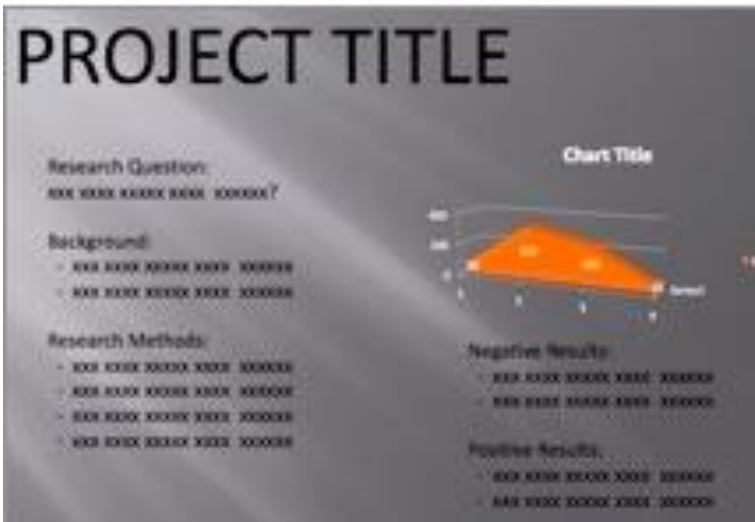

Poll: Which poster would you like to read? A, or B?

Open comments: Are there any suggestions for improvements?

Background and colors

- Background
 - Check your university/lab for template
 - Color costs more to print
 - Hard to read dark on dark

utexas.edu/ugs/our/poster/create_message/design

Background and colors

- Background
 - Check your university/lab for template
 - Color costs more to print
 - Hard to read dark on dark
 - Picture background – expert
 - Obscures graph details
 - Red on green
- Colors
 - Don't clash, but use contrast
 - no red on black or yellow on white
 - Be cognizant color blind (red/green)
 - I suggest dark text on light background

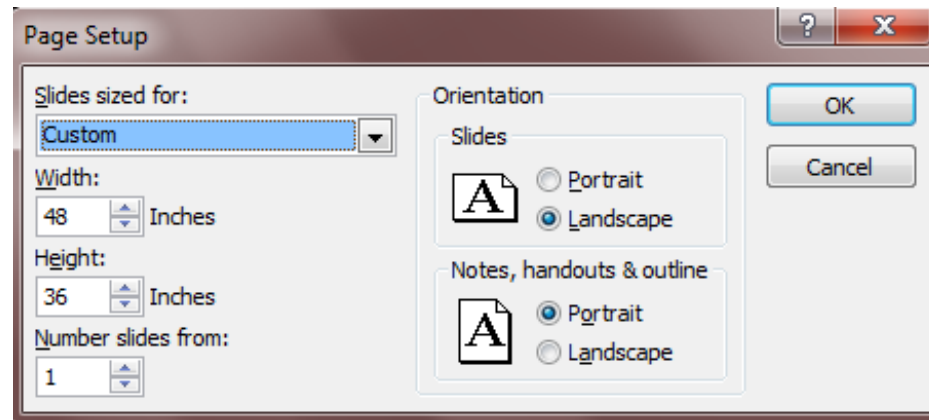

utexas.edu/ugs/our/poster/create_message/design

Assembling the poster

- Size and format
 - Generally landscape
 - In Powerpoint: Design\Page Setup

- Don't need to fill entire poster board
 - e.g., 4'x8' is VERY big

Assembling (cont)

- White space – not enough --->
 - Divide sections w/ empty space

utexas.edu/ugs/our/poster/create_message/design

Assembling (cont)

- White space – not enough --->
 - Divide sections w/ empty space
- Printing
 - Printing individual slides - not advised
 - Send PPT and PDF to campus printing service (~\$30-\$50)
 - Kinkos/Fedex ~ \$8/sq. ft. (start at ~\$50)
 - Compress pictures - size of files < 5 MB if possible

utexas.edu/ugs/our/poster/create_message/design

Abstract

Over 1.5 million bone fractures each year in the U.S. are attributed to osteoporosis. Osteoporosis is a skeletal disorder that causes bones to break down faster than they are formed [1]. Fractured osteoporotic bones (OB) are difficult to fixate. Comparative testing is necessary to determine a plating system that best fixates fractured OB; however, cadaveric OB vary too greatly to use for comparison [2]. The goal of this study was to develop a biomechanically sound model of OB to be used in the comparison of fracture fixation plating systems. To be considered osteoporotic, the model must have 81.3% the ultimate tensile strength (UTS) of normal bone (NB) [3]. Chicken femurs were separated into 4 groups; a control group and 3 experimental groups. Each experimental group was treated in 0.6M hydrochloric acid (HCl) for different set periods of time [4]. Three-point bending tests were conducted on the bones to compare the mechanical properties of each group [3]. From initial testing, it was predicted that the bones would reach osteoporotic UTS after being treated for 33 minutes. After final testing, it was determined that it would take 37 minutes for the bones to reach osteoporotic UTS in 0.6M HCl. Chicken femurs treated in HCl were found to make a model of OB that can be easily reproduced for the comparison of fracture fixation plating systems.

Methods

- Chicken femoral bones were used as models – they have similar micro-structural characteristics to human bones [5].
- The bones were treated in 0.6M HCl baths for varying increments of time between 0 and 6 hours.
- Three-point bending tests were conducted on the bones with a loading rate of 0.1mm/sec [2].

Figure 1: Chicken femora bone sample displayed on 3-point bending apparatus.

Figure 2: Diagram section of bone [6]

$$E = (P/V) / (L^3 / (48 \cdot I)) \quad (\text{Eqn.1})$$

$$I (\text{Inertia}) = (\pi / 64) (D^4 - d^4) \quad (\text{Eqn.2})$$

$$P/V = \text{slope of force-displacement} \quad (\text{Eqn.3})$$

$$M (\text{Moment}) = (P_{\text{max}} \cdot L) / 4 \quad (\text{Eqn.4})$$

$$UTS = (M \cdot D) / 2 \cdot I \quad (\text{Eqn.5})$$

Nice schematics over photo

- Initial testing was conducted to determine the time that the model would reach osteoporotic UTS.
- Equations 1-5 were used to calculate the UTS for each group.
- The resultant mean UTS for each group was compared to the mean UTS for the control group.
- The mean UTS for each group was compared to the mean UTS for the control group to determine a smaller range of times to treat the bones.
- From the analysis of the initial tests, new times of 0, 30, 60, and 90 minutes were chosen.
- The UTS of the chicken femur as found in literature was 96MPa [7]. If the control bones show similar UTS properties to those in literature, to be considered osteoporotic, 81.3% of NB UTS, the bones should exhibit a UTS of 78.0MPa [3].

Results

Table 1: Compilation of the measurements and the calculations for each bone tested in the control group and the 3 experimental groups treated for 30, 60, and 90 minutes.

Too much raw data in table

Figure 3: Representative Force-displacement plot with linear fitting of a sample control bone. The slope of the linear fit is used as the (P/V) value in calculating the E (Eqn. 1).

Figure 4: Sample bones after being subjected to a compressive force on the 3-point bending apparatus. The bones failed transversely.

UTS-time plots with exponential fitted curves used to determine the time points in 0.6M HCl to create an osteoporotic bone model. The first graph contains all of the data points for each treatment (0, 30min, 6hrs.). The second graph contains the data points for the treatments of (0, 30min, 90min).

Control and osteoporotic UTS values as found from literature, the initial and final testing. The times calculated from the exponential fitted curves in Fig. 5 to make the bone osteoporotic are included.

	Control UTS (MPa)	Osteoporotic UTS (MPa)	Time (min.)
Literature	96.00 [7]	78.05	
Initial	86.05	69.92	33.24
Final	76.98	62.58	37.41

Acknowledgements

Thank you to: Dr. Kristen Billiar, Mathilda Rudnicki, & Lisa Wall

Nice pictures – but not every sample needed

- this similarity in treatment time supports the reproducibility of this model.
- Limitations:
 - The E values were not analyzed in the making of this model – the values did not show to be consistent with the treatment times.
 - The chicken femoral bone is smaller than the human bones that would need the fracture fixation plating systems – may be difficult to compare.
- A greater sample number should be tested and measured with more accurate tools.
- Work should be done to create a model that can have both osteoporotic UTS and E.

Abstract

Background color makes poster stand out – but minimal actual area covered

1. in bioengineering
2. to facilitate personal and professional development of the students in areas important for careers in engineering
3. to provide middle school students with one-on-one mentored laboratory experiences with positive engineering role models that they can identify with

REU Activities and Examples

Activities	Examples
Independent bioengineering research projects	Tissue engineering, biomaterials, microbial infections, and nanotechnology
Faculty mentors from multiple departments	Biomedical Engineering and Chemical Engineering
Weekly seminars and workshops	Mentoring skills, ethics in science, professional presentations skills, how to choose a graduate school, professional writing, etc.
REU students act as mentors to middle-school students	One-week full-time Bio-Discovery Program
Professional presentations	Program symposium presentations at (BMES) including presentation

Outcomes

Research activities: REU students assessed, with many increases in hypothesis and research design experiments. Create a data analysis plan; Use laboratory equipment; Interpret data to make decisions. Also, most mentors indicated that their REU mentee had become an independent researcher over the summer.

Professional proficiency: REU students reported gains in all areas with many increases being statistically significant: Research presentations, Professional writing, Professionalism and ethics, Preparation for applying to graduate school, and Mentoring. Also, 6 of 10 students attended the Biomedical Engineering Society national annual conference, with 5 posters and one platform presentation.

Outcomes for Middle-School Students

Color helps table

Outcomes	Outcomes
Group projects (examples): •Pig heart dissection •Structure building contests •Edible "blood" and liquid N ₂ ice cream!	•78% report more interested and 22% slightly more interested in science than they were before •78% "strongly agreed" and 22% "agreed" that they "could be an engineer if I wanted to."
Independent projects: •1-on-1 mentoring by REU student •Posters based on individual projects, e.g., "Building Prosthetics", "Heart rate and Exercise", "Bone Strength", "Diffusion," etc.	•Student quotes: "I loved every part." "the pig heart was amazing." •REU student comment: "I [was loved] seeing the changes in the girls from skeptical/don't want to be there to enthusiastic"

REU Student Profile (2010)

163 Applicants: 133 (82%) female, 37% were non-white, of which 7% were black and 9% were Hispanic

10 Participants: 80% female, 50% minority (20% Black, 10% Hispanic, 10% Asian, 10% White/Native American)
60% from schools that do not offer a Ph.D. in BME (including 3 from community college)
2 participated as supplement to RET

Broader Impacts (2004-2010)

- Training provided to 45 female undergraduates in bio-engineering research (>30% underrepresented minorities)
- Positive career impact encouraging graduate study
- High percentage present at national meeting (e.g., BMES) (6 of 9 in 2008, and 6 of 10 in 2010)
- Positive mentoring experience
- Mentoring provided for 41 female middle-school students
- Improved interest in STEM for middle school girls

Acknowledgements

This work was supported by the National Science Foundation (EEC0754996 and EEC0452809 (completed) and EEC0743037 (RET)). We thank all the WPI graduate students and faculty who participated in mentoring the students.

Cell sensing on strain-stiffening substrates is not fully explained by the nonlinear mechanical property
 Mathilda Rudnicki, Kristen Biller
 Biomedical Engineering Department, Worcester Polytechnic Institute, Worcester, MA

Introduction
 Cell sensor: a) Geometry, migration and differentiation; b) percent upon surrounding cells; stress and signal density [1-3].
 Fibroblast spread area generally increases with substrate stiffness. Finite element analysis (FEA) illustrates that if a cell substrate is stiffer than a cell layer, response to spreading as it is "near" the cell-substrate displacement has been measured upon tumor in the air boundary (c) upon what surface on soft form gels (d). The effect may be explained by the nonlinear properties of the cell gel.

Methods
 Finite element model was developed to simulate a cell contracting near an annular region of constant traction on a substrate with a non-linear modulus. The model was created in ABAQUS/CAE, with 8-noded quadrilateral axisymmetric elements and analyzed in a static general step.

Results - FEA
 • Substrate were more effectively stiffer by varying the thickness in the nonlinear material, stresses are "thinner" while strains are "thick" but further spread than in the linear material.
 • The nonlinear material is affected by both thickness and traction along the center.

Results - Experimental
 • No distinct round-to-square transition on nonlinear gels (non-collagen) like on linear gels (PA).
 • This sort of transition is quantified by fitting the data to a rational equation, where a indicates curvature.

Conclusions and Future
 • From FEA, the nonlinear material experiences "stress bunching" further strain transmission.
 • Effective stiffness ($E_{eff} = \frac{E \cdot t}{1 + \nu}$) of the nonlinear material is higher than linear material.
 • Fibroblasts on nonlinear gels do not so enhance a distinct "thick" where these cells increase both round and stiff (square) material response, minimize variation in cell spreading.

Poster Presentations

More than just the poster...

Craig J. Goergen, PhD

Purdue University

cgoergen@purdue.edu

Outline

1. Audience identification
2. Engage presentation
3. Networking
4. Other resources
5. Take-home messages

Know Your Audience

- Who will you be speaking with?
- What way will you peak their interest?
- How can you adjust your presentation?

<http://www.mnmas.org/>

Know Your Audience

- Example: BMES Annual Meeting
 - Biomedical engineers
 - Broad backgrounds and interests
 - Hoping to view many posters

Engaging Presentation

- Prepare a 2-4 minute talk
 - Provide a clear background
 - Focus on highlights and figures
 - Summarize major points
 - Put work in larger context
- Practice talk beforehand
 - Scientific colleagues and others
 - Incorporate feedback

<http://web.mit.edu/bmes/www/PosterSession.html>

Questions to Ask

- Ask to take others through your work
 - "Would you like an overview of my poster?"
- Find out their background
 - "Do you have any particular interests?"
- Make it a conversation
 - "Does that make sense?"

Polling Question

When presenting a poster, should you look at:

- 1) The poster?
 - That is the most important aspect
- 2) The viewer?
 - They should be your primary focus
- 3) Both the poster and the viewer?
 - Directing attention

Human Interactions

- One engaged viewer attracts others
- Firm handshake
- Make eye contact
- Be confident
 - But don't be afraid to say you don't know

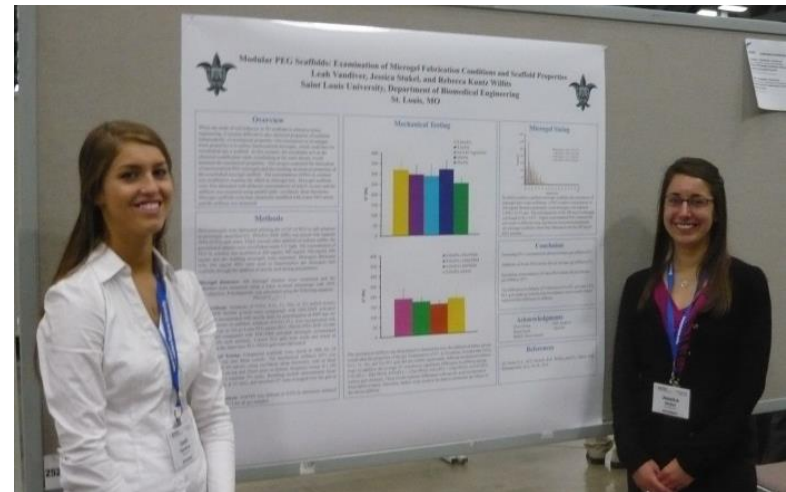

<http://clearedjobs.net/blog/9-interviewing-mistakes-security-cleared-job-seekers-should-avoid/handshake/>

Communicating Effectively

- Speak clearly and slowly
- Ask if anyone has questions
- Smile and have fun 😊

<http://parks.slu.edu/news-events/news/2010/10/26/bmes-2010-conference/>

Interactive Posters?

- Animations
 - Laptop, phone, tablet
- Physical objects
 - Show-and-tell
- Demonstrations

<http://www.engadget.com/2006/06/07/pepsi-posters-let-you-plug-in-your-headphones/>

<http://eloquentscience.com/wp-content/uploads/2011/02/Poster.jpg>

Polling Question

Do you bring business cards to conferences?

1) Yes

- Carry them with me at all times!

2) Sometimes

- When I don't forget.

3) No

- Why would I need those?

4) What is a business card?

Handouts

- Contact information exchange
 - Business cards
 - Phone bump
 - <http://www.youtube.com/watch?v=4kCXKrAbdiQ>
 - *Ask for their information*
- Legible paper printout of poster
 - Also available online
- Pamphlets, publications, etc.

<http://www.zazzle.com/businesscards>

After the Conference

- Learn about those who stopped by
- Follow up with emails and phone calls
 - Thank them for their interest
 - Send supporting publications
- Connections can last

Other Resources

- Preparing and presenting effective research posters

- Do's and don'ts of poster presentations
 - <http://www.stanford.edu/group/blocklab/dos%20and%20dongs%20of%20poster%20presentation.pdf>

Take-Home Messages

1. Know your audience
2. Develop engaging presentation
3. Be confident
4. Network before, during, and after
5. Have fun!

Polling Question

Do you know feel more confident about how to prepare an effective poster presentation?

1) Yes

- This was helpful

2) Somewhat

- Still confused about some aspects

3) Not really

- I was an expert already
