

# INDUSTRY MAKES

## THE ENVIRONMENT OUR PRIORITY.

Every day, industry employees go to work not only to produce great products that make our modern lives better but also to ensure that how they make those products is sustainable for themselves, their families, their community and the surrounding environment.

Many industrial sites in Louisiana own adjacent properties where wildlife, leased farmlands and farm animals flourish. Several sites have become Certified Wildlife Habitats through the [Wildlife Habitat Council](#) and foster successful bird and plant species by seeding, building bird houses and employee clubs who take pride in cultivating and protecting the environment.

### Industrial Hygiene

Industrial workers receive periodic devices that monitor their exposure to the chemicals that are produced in the plant where they work to ensure that the environment where they work is safe. This front-line worker monitoring is a great way of knowing that not only are workers safe but also that surrounding community members are too.

### Water Quality

Each time it rains, water runs off industrial plant surfaces on to the ground, taking with it any residual chemicals. So, plants have constructed dikes to contain the runoff from their plant and each time it rains, the water is tested for safety and cleanliness **before** it is allowed to be released from the property to the environment.
