Summer Meeting a Success

REMEMBER,
LIKE IT OR
NOT, IF YOU
ARE IN
BUSINESS,
YOU ARE IN-

The Summer Meeting for 2010 is now history. Perhaps the most pressing question that came out of the many discussions of the Tennessee Concrete Association's future was, "Where do we go from here. What's the Next Big Thing?" The promotion of pervious concrete is a demonstrable success, but what do we promote now? Although the turnout was somewhat tepid, the ones who were at the summer Meeting were very engaged and discussions were more provocative than usual. I believe that since we reduced the number of major meetings to only two per year, every producer/member should commit to attending at least one meeting every year. Producer/Members attendance is crucial. Associate and Affiliate members see more value in belonging to TCA when Producer/Members attend. The TCA needs participation and ideas—dues are extremely important of course, but attendance and new ideas are just as critical, especially now.

I think credit for the success of the summer meeting was due to the quality of the program. The *Strategic Planning* sessions included a timely and informative presentation from WAP Sustainability Consulting. The sustainability movement is here to stay and all of us need to be informed in order to keep current with this trend.

There are so many things the Association is doing that it is easy to miss some of the major accomplishments and opportunities available. The 2010 Concrete Conference, The Integrated Project Delivery initiative with MTSU, the National Design Competition with the Tilt-Up Concrete Association, Lafarge's Concrete Appreciation Day, the TCA Concrete Village, the research projects on pervious concrete, and of course our ongoing involvement with the CIM Program at MTSU, which is currently work-

ing on a new MBA program with an emphasis on concrete. Add to that the TDOT Liaison Committee's work, the OES Committee's work with the GreenStar Plant Initiative and OSHA Safety Program, the Technical Committee's Round Robin Testing and the Tennessee Tree project in conjunction with the Tennessee Environmental Council and it is apparent that TCA is working hard for its members.

Participation in the Association is more vital now than at any other time that I can remember. The challenges facing TCA are just like the ones we are all facing with our businesses: How to survive the current economy? Our revenue is down and it is hard to get our membership out to support our events. I don't have the magic answer for that, but I don't want to contemplate the alternative, either. We all need TCA. Three main reasons that TCA is relevant came out of the Strategic Planning conversations which are: Certification Services, Compliance/Technical/General Assistance, and Promotion. It was a pleasant surprise that the TCA Board approved the addition of ten new members—five Contractors and five Affiliates.

Finally, another item of interest presented at the meeting is the new Tennessee Concrete Industry Political Action Committee (PAC). PAC will be comprised of cement producers, ready-mix producers, and contractors. A large-scale mailout is underway with pledge cards along with a letter from Chairman Mickey Bradley explaining the new organization's goals. The current proposal by the EPA to classify fly ash as a hazardous waste material is a good reason for all of us to be politically involved. Please take some time to review the goals of the PAC and make sure to support it. Remember, like it or not, if you are in business, you are in politics.

TCA: Providing Services

Working with Members and the Community

We are launching a new consumer oriented website on September 1 to connect our contractor members with customers looking for high quality concrete workmanship. Visit www.getconcrete.org beginning September 1.

In our last issue we talked about the broad issue of Sustainability, and we explored some specific behaviors that we could adopt to be more sustainable in our personal lives, and our businesses. I mentioned that TCA is participating in Tennessee's TP3 program as we seek to improve our sustainability profile. I am proud to announce that we have just advanced to the Partner level of this program and we hope to achieve the top level of Performer in the next few months. We want the concrete industry to be well represented in the TP3 program, and right now it is pretty lonely. If your company would like to join us, please contact us and TCA will help you get started in the TP3 program. For our ready mix members, TCA can also help you get started on the path to Green-Star Plant certification. Just a couple of the things TCA is doing to help the concrete industry accelerate it's sustainability journey.

2010 has seen a lot of activity at the TCA campus in Nashville. Our members receive regular email updates about our progress, but the best way to see the progress is to stop by—we love to have visitors and are proud to show off what the concrete industry can do. We have several examples of pervious concrete as well as other Low-Impact Development techniques, like our rain garden and our multiple rain-harvesting cisterns. Other

site features include a full-scale Safe Room, multiple types of decorative concrete, concrete fencing, and more.

We are working with our members and the Tennessee Environmental Council to plant one million trees in Tennessee by 2020. We are conducting both field and laboratory research to improve pervious concrete pavements, and are providing assistance on real-world pervious projects all across the state. TCA conducts dozens of certification classes for the industry every year as the Local Sponsoring Group for both the American Concrete Institute and the National Ready Mixed Concrete Association. And, we are launching a new consumer-oriented website on September 1 to connect our contractor members with customers looking for high quality concrete workmanship. You can visit www.getconcrete.org on September 1 to check it out.

All of this activity (and more!) is made possible by our member companies. This is our annual Directory issue, so I encourage you to keep this issue handy throughout the year and refer to it often. TCA couldn't exist without the support of our member companies. I encourage you to support our members by doing business with them whenever you can. If you feel like your name should be listed in this Directory, we would love to welcome you as our newest member!

The Road to Shambala

INTRODUCTION

Pervious concrete utopia (Shambala) is where low cost pervious PCC mixtures requiring low compaction have good permeability and an average core compressive strength of 4000-psi at 28-days. In Shambala, the interstates are overlaid with pervious PCC improving skid resistance, reducing truck spray and noise and virtually eliminating hydroplaning. Finding Shambala, although not as good as finding Eldorado, would be a true cause to celebrate and a joy to the world, the concrete world that is. Shambala lies at the corner of the Right Amount of Paste Avenue and Good Aggregate Street. I recently got a tip on how to find Good Aggregate Street, I would rather not reveal my source; let's just say I heard it through the grapevine. The tip stated that ASTM C 29 dry-rodded-unit-weight (DRUW) voids were the key to finding Good Aggregate Street. In the showdown between concrete and asphalt, we can leave no stone unturned. Since I can't get it out of my head, I decided to investigate.

MATERIALS AND MIXTURES

All mixtures in this very preliminary investigation contained 480-lbs/CY of Type I PC, 120-lbs/CY of Class F fly ash, and 180-lbs/CY of water. Each mixture also contained small doses of the following chemical admixtures: mid-range water reducer; hydration stabilizer; and a viscosity modifier. All mixtures were designed with twenty percent nominal air voids. Each mixture contained sufficient aggregates to attain a design volume of twenty-seven cubic feet. Aggregates were selected to produce a range of DRUW voids. The project was not funded and aggregate selection was also based on availability. Fortunately, several aggregates were donated by members of the concrete industry.

PROCEDURE

The DRUW voids of each aggregate combination were determined as per ASTM C 29. All pervious PCC batches were 0.6-cubic feet in size. Each batch was mixed in a one-cubic foot capacity electric shear mixer. One ASTM C 1688 plastic unit weight test was performed and one 6x6x24-inch beam was cast from each batch. All beams were cast in one layer in reusable wood molds. Each beam was compacted with two passes of a 6x12-inch concrete rolling pin. Following casting, each beam was covered with plastic and allowed to cure for approximately 24 hours. The next day, the beams were de-molded and placed in a lime-water immersion tank. The beams were cored at seven to ten days. Four cores were cut from each beam. Two of the cores were used for compressive strength and two were used to determine ASTM D 7063 hardened effective void content. The two cores used for

ASTM D 7063 hardened effective void determination were dried at 230°F for seven days. Compressive strength was determined at 28 days using the other pair of cores.

RESULTS

Results are shown in Table 1.

ANALYSIS OF PRELIMINARY RESULTS

The ASTM C 29 DRUW voids of the aggregate are primarily a measure of aggregate gradation but are also influenced to a lesser degree by aggregate angularity and surface texture. DRUW voids increase with increasing gradation uniformity, increasing angularity and rougher surface texture of the aggregate. Aggregate DRUW voids can be manipulated by blending fine aggregate with the selected coarse aggregate.

The authors attempted to determine if the DRUW voids of the selected aggregate combination affected the plastic and hardened voids and compressive strength of pervious PCC. Figure 1 shows a promising relationship between aggregate DRUW voids and ASTM C 1688 plastic voids. No relationship was found between aggregate DRUW voids and ASTM D 7063 hardened PCC voids. Figure 2 shows a promising relationship between aggregate DRUW voids and pervious PCC core compressive strength.

OBSERVATIONS

1. Seven data points is not enough to draw conclusions. More data is needed.
2. Aggregate DRUW voids may be helpful in selecting aggregates for pervious PCC.
3. Aggregate DRUW voids can easily be decreased using fine aggregate blending.
4. Shambala is just over the next hill. I saw it briefly.
5. If you found seven different song titles in the first paragraph, you have heard music from the early 1970s (I did not say or even imply that you were old).

ACKNOWLEDGEMENTS

The authors sincerely appreciate the assistance provided by Aaron Crowley and John Hendrix, P.E.. We also greatly appreciate the materials provided by Denny Lind of BASF Admixtures, Inc., Brian Strevel of SEFA Group, Clark Simpson of Builder's Supply, Dennie Underwood of Blaylock, Inc., and Alan Sparkman of TCA.

Help for Pervious PCC Producers

Part 1: Supplementary Cementing Material Substitution Rates—It's Good to be Green!

INTRODUCTION

Tennessee Technological University (TTU) researchers have recently been exploring ways to improve conventional (compacted) pervious Portland cement concrete (PCC). The Tennessee Concrete Association (TCA) has provided materials and guidance for the research described in the articles. We hope you find the information presented helpful in producing improved pervious PCC mixtures. In the first article, making pervious “greener” is explored. Parts 2 through 4 in the series will examine:

2. Chemical Admixtures for Pervious PCC
3. Fine Aggregate for Pervious PCC
4. Putting It All Together for a High Performance Pervious Concrete Mixture Design

Pervious PCC is already “green” by application. Could it be made even “greener” with the use of supplementary cementing materials? Tennessee concrete producers are already familiar with some of the other benefits of supplementary cementing materials (SCMs) including increased compressive strength and reduced material costs. Former TTU Graduate Student Jason Phillips [1] explored SCM substitution rates for pervious PCC in order to maximize environmental benefits and compressive strength while reducing material costs.

MATERIALS

One Class F and two Class C fly ashes meeting ASTM C 618 [2] were obtained from regional suppliers. Grade 120 ground granulated blast furnace slag meeting ASTM C 989 [3] was obtained from a national cement manufacturer. Type I Portland cement [4] was obtained from a local ready mix producer's bulk storage. An ASTM C 33 [5] No. 8 limestone was obtained from a local quarry. The average results of a washed sieve analysis [6] conducted in triplicate on the local limestone are shown in Table 1. Chemical admixtures were provided by the local representative of an international chemical producer.

RESEARCH PLAN

The research team developed a pervious PCC mixture (see Table 2) to act as the control or standard for comparison for the project. Throughout the research, the volumes of paste, aggregates, and water were held constant for all variable mixtures. Only the volume of chemical admixtures (dosed by cementing materials weight) varied slightly for the mixtures due to the specific gravities of SCMs differing from that of

Portland cement (PC). Cementing material composition was varied by substituting various SCMs on an equal volume basis for PC. SCM substitution rates ranged from 12.5 to 62.5 percent by volume of cementing materials. The control mixture was replicated three times. All other mixtures were only produced one time due to the large number (23) of variable mixtures in the study. The research team assumed that in the future, more promising variable mixtures could be further investigated. In order to compare cementing material costs, the following cost per ton assumptions were made: PC \$125, Class F fly ash \$27, Class C fly ash \$38, and Grade 120 slag cement \$80.

Figure 1. Severe Paste Drain Down

PROCEDURE

All pervious PCC batches were 0.65-cubic feet in size. Each batch was mixed in a one-cubic-foot capacity electric mixture. Ten 4x8-inch cylinders were cast from each batch. Eight of the cylinders were used for compressive strength determination and two were used to determine effective void content and to assess drain down of the paste. All cylinders were cast in two layers in reusable metal molds. Each layer received 4 blows from an AASHTO T 245 Marshall Hammer [7]. The Marshall Hammer is one of the compaction devices being considered by the ASTM Pervious PCC Standard Test Method Subcommittees. Following casting, each cylinder was covered with plastic and allowed to cure for approximately 24 hours. The next day, the

50PC/35S/15C1					31.6	
	Slight Drain Down	Moderate Drain Down			Slight Drain Down	

cylinders were de-molded and placed in a lime-water immersion tank. On the seventh day, the two effective voids cylinders were removed from the curing tank and dried at 230°F for seven days. Effective void contents were then determined as per ASTM D 7063 [8]. Paste drain down was determined by visual inspection. An example of severe paste drain down is shown in Figure 1. Compressive strengths were determined for each batch at 7, 28, 56, and 91 days using a pair of cylinders. On the day of a scheduled break the pair of cylinders was removed from the curing tank and capped with sulfur mortar as per ASTM C 617 [9] and subsequently tested in accordance with ASTM C 39 [10].

RESULTS

The results of the project are truly voluminous – 200+ compressive strengths and 50+ effective void contents. Average results are shown in this article, for more detailed information see Phillips [1]. Table 3 shows average effective void contents and paste drain down in four categories: minimal (no shading), slight (yellow), moderate (orange) and severe (red). Control compressive strength results are shown in Figure 2. Similarly, Class F, Class C No.1, Class C No.2, Grade 120 slag and tertiary

—Continued on page 12

by L. K. Couch

Help for Pervious PCC Producers

Part 1: Supplementary Cementing Material Substitution Rates—It's Good to be Green!

mixtures compressive strength results are shown in Figures 3 through 7, respectively. Each result is the average of two compressive strength cylinders at the prescribed age.

ANALYSIS OF RESULTS

Effective Void Content

The variation in effective void content was small for the project. The small standard deviation suggests that there is no difference for results between 31.2 and 33.5 percent [1]. The vast majority of results fell within this range. High substitution rates of fly ashes tended to cause paste drain down rather than effective void contents that were too low.

Paste Drain Down

Class F and Class C fly ashes act as water reducers in conventional PCC mixtures [11]. It appears that is also true for pervious PCC mixtures. In particular, Kosmatka [11] shows that Class C fly ash is a more effective water reducer for conventional PCC. That also appears to be the case for pervious PCC in this project. At the same substitution rate, Class C fly ash caused more severe paste drain down than Class F fly ash (see Table 3). Paste drain down indicates that the mixture needs to be proportioned (probably with less water). Further, paste drain down will be less severe in the field than in the laboratory due to the voids in the underlying aggregate base. Grade 120 slag cement was not as effective as a water reducer as either fly ash in this study. No mixture containing only slag as an SCM, suffered paste drain down at any substitution rate.

Sustainability

How sustainable or “green” a PCC mixture is a function of the amount of recycled materials it contains. Since virgin aggregates were used throughout the project, the sustainability of mixtures in this project was a function of the SCM substitution rate (the higher – the greener). Since slag mixtures showed no paste drain down at 62.5 percent substitution, the research team decided to try a slightly modified (7 lbs/CY less water and 4 oz/cwt hydration stabilizer) mixture at 75 percent slag substitution by volume of cementing materials. The resulting mixture had an average effective void content of 33.3 percent, average compressive strengths of 1940 and 2090-psi at 7 and 28 days respectively and no paste drain down. Even higher substitution rates may be possible but were not explored in this project. Grade 120 slag cement allows the “greenest” pervious PCC mixtures.

Compressive Strength

Table 4 shows the average compressive strength of each fly ash and slag SCM mixture as a percentage of the average compressive strength of the control mixture at the same age.

Since each variable mixture was only produced once, insufficient data was available for t-test comparisons to determine if differences observed were significant. Therefore, a ten percent difference from the average control mixture at that age was considered significant for this project. Table 4 is color coded for easier analysis: red shading indicates a twenty percent or more decrease in compressive strength; orange indicates a ten percent decrease; yellow indicates that the variable mixture strength is less than ten percent different from the average control compressive strength; Blue indicates a ten percent increase; and green indicates a twenty percent or more increase in compressive strength compared to the average control. Table 5 is very similar to Table 4 except that all tertiary variable mixtures had a fifty percent substitution rate. The color coding used is the same as Table 4.

All but three of the substitution-age combinations were neutral (no significant difference) or beneficial to compressive strength development. The three detrimental substitution-age combinations were all at seven days of age. The results of all three of the cases improved to neutral or beneficial at later ages. Neutral is actually a very positive result because the producer will be delivering a “greener” pervious PCC at lower cost (more in the following paragraphs) without a significant compressive strength reduction.

The compressive strength results shown here are from samples continuously cured in lime-water. Since adequate moisture and temperature for curing are not guaranteed in the field, it would take much longer for pervious PCC samples in the field to reach a 56 or 91 day laboratory curing level, if they ever reached that level. Seven and 28 day levels of laboratory curing are much more achievable in the field. Except in rare circumstances, pervious PCC producers should concentrate on the 7 and 28-day compressive strength results.

Class C fly ash was the most beneficial SCM to compressive strength improvement at almost all substitution rates and ages. For 50 percent or lower substitution rates, Class C fly ash was always neutral or beneficial at 7-days. Class C fly ash truly excelled in improving 28-day compressive strength, in ten cases the following results were obtained: six 20 percent or more benefits; three 10 percent or more benefits; and one neutral result. Twenty-eight days is the most common specification time and therefore the most important time to excel in improving compressive strength.

Cementing Material Cost

Table 6 shows cementing material costs based on the earlier stated cost-per-ton assumptions (PC \$125, Class F fly ash \$27, Class C fly ash \$38, and Grade 120 slag cement \$80). Table 6 is color coded for easier analysis: red shading indicates a twenty

Figure 2. Control Mixture Compressive Strength Development

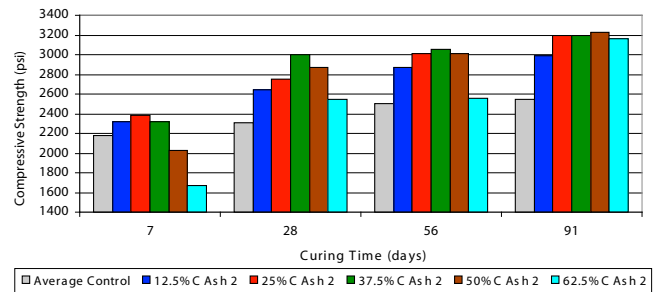

Figure 5. Compressive Strength Development of Class C Fly Ash Number 2 Mixtures

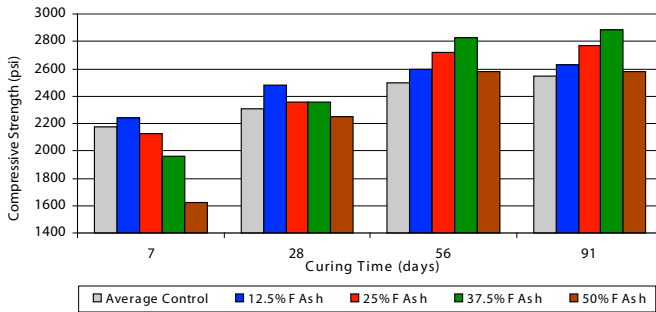

Figure 3. Compressive Strength Development of Class F Fly Ash Mixtures

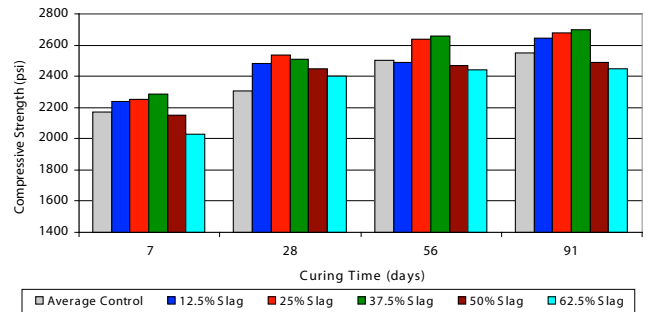

Figure 6. Compressive Strength Development of Grade 120 Slag Cement Mixtures

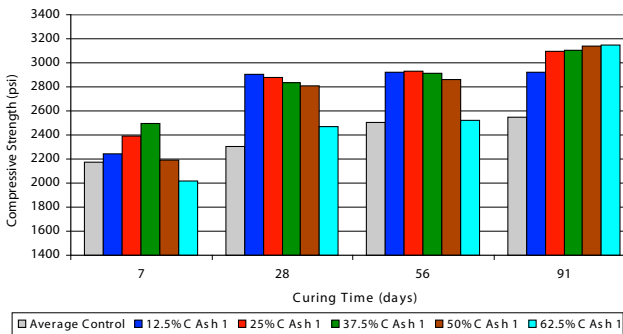

Figure 4. Compressive Strength Development of Class C Fly Ash Number 1 Mixtures

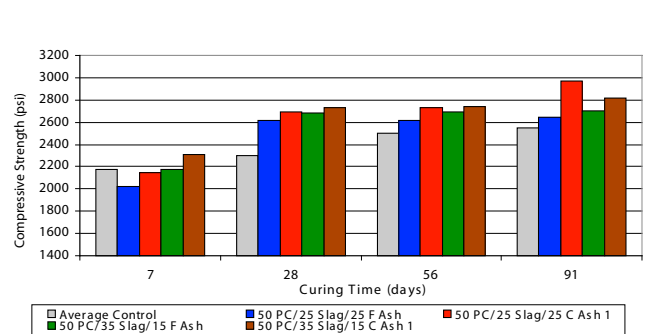

Figure 7. Compressive Strength Development of Tertiary Mixtures

percent or more increase in cost; orange indicates a ten percent increase; yellow indicates that the variable mixture cost is less than ten percent different from the control cost; Blue indicates a ten percent decrease; and green indicates a twenty percent or more decrease in cost compared to the control cost.

Class F fly ash was the clear winner in cementing material cost reduction for pervious PCC. Class F fly ash produces the maximum cost reduction for cementing materials at all substitution rates. Further, Class F fly ash significantly (10% or more) reduces cementing material costs at the lowest substitution rate tested (12.5%).

SCM SUBSTITUTION RATES FOR PERVIOUS PCC - HELP SUMMARY

The research presented herein is exploratory in nature, additional batches of the more promising mixtures should be produced to confirm the results obtained. Based on the results from this study, the following advice can be offered to pervious PCC producers.

1. SCM substitution in pervious PCC is almost always beneficial. It improves sustainability and

—Continued on page 14

by L. K. Couch

Help for Pervious PCC Producers

Part 1: Supplementary Cementing Material Substitution Rates—It's Good to be Green!

reduces costs. Compressive strength can usually be maintained or improved.

2. For typical 28 day compressive strength specifications, 25 to 37.5 percent substitution by volume of a single SCM or a tertiary (50 percent substitution) mixture worked well. Consider higher substitution rates when longer curing periods are available.
3. Always make a trial batch of the pervious PCC mixture to check for SCM / admixture compatibility, compressive strength, effective voids and paste drain down.
4. Although each SCM contributed to improving pervious PCC. Each SCM excelled in a different area. Choose the appropriate SCM for the primary mixture purpose:
 - **Sustainability** - Grade 120 slag cement allows the “greenest” pervious PCC mixtures. Grade 120 slag cement can be substituted at the highest rates by volume of cementing materials without compromising pervious PCC properties. Substitution rates as high as 75 percent by volume can produce pervious PCC mixtures with adequate compressive strength and effective voids without paste drain down.
 - **Compressive Strength Improvement** - Class C fly ash was the most beneficial SCM to pervious PCC compressive strength improvement at almost all substitution rates and ages. Class C fly ash truly excelled in improving 28-day compressive strength, compressive strength was significantly (10% or more) improved in nine of ten cases. Twenty-eight days is the most common specification time and therefore the most important time to excel in improving compressive strength.
 - **Reducing Cementing Material Cost** - Class F fly ash was the clear winner in cementing material cost reduction for pervious PCC. Class F fly ash produces the maximum cost reduction for cementing materials at all substitution rates. Further, Class F fly ash significantly (10% or more) reduces cementing material costs at the lowest substitution rate tested (12.5%).

ACKNOWLEDGEMENTS

The work reported in this paper was Jason Phillips' Master of Science research topic. The author appreciates Jason's extensive work on this topic. I sincerely appreciate the assistance provided by former TTU students Derek Godwin and J. D. Self. I also greatly appreciate the materials provided by Denny Lind of BASF Admixtures, Inc., Brian Strevel of SEFA Group, Clark Simpson of Builder's Supply, Russell B. Stapp of Headwaters Resources, George C. Zima of Lafarge and Curtis Gould of

Boral. I also gratefully acknowledge the financial support, financial project management, and computer assistance of the TTU Center for Energy Systems Research. Thanks to the TTU Department of Civil and Environmental Engineering for providing supplies and student salary for the project.

AUTHOR INFORMATION

L. K. Crouch, Ph.D., P.E. is a professor of Civil Engineering at Tennessee Technological University. ❖

TCA Services & **STAFF**

The Tennessee Concrete Association (TCA) was founded in 1986 to promote the increased use of ready mixed concrete in Tennessee. Our mission statement is: "The TCA is the unified voice for the concrete industry to improve our image and awareness through advocacy, promotion and education that support our members, our community, and our future." We work to fulfill this mission in all of our activities. We invite you to join us in building a concrete industry we can all be proud of.

Supported primarily by membership dues, the association is governed by a 15 member board of directors elected annually by members. The board includes 10 ready mixed producer members who direct local promotional programs in each of our three regions.

2010 TCA PROGRAMS

Promotion

Annual Convention – This event brings all members together to celebrate the year's accomplishments.

Concrete Conference – Held each year to update architects & engineers on current concrete practices.

Tennessee Concrete Magazine – Published 3-4 times annually.

Membership Directory – Published annually with information advertising your company.

E-Newsletter – To keep you informed of Association programs, industry activities and promotional events.

Concrete Excellence Awards – Design Construction and Environmental awards.

Product Demonstrations – Decorative, Pervious, Insulated Concrete Forms, Ultra-thin Whitetopping, & Flowable Fill.

Literature Development – Statewide High School Concrete Essay Contest.

Product Promotion Kits – Kits available for sales helps.

Trade & Home Show Displays

TCA Website – www.tnconcrete.org and the Intranet for up-to-the minute calendar events.

Video & Technical/Promotional Literature Library – Maintained as a members resource.

Training and Certification

ACI Field Testing Technician, Grade 1

ACI Flatwork Finisher & Technician

ACI Concrete Laboratory Testing Technician Grade 1 & 2

ACI Concrete Construction Special Inspector

ACI Concrete Strength Testing Technician

NRMCA Certified Driver Training

NRMCA Certified Concrete Production Technologist

NRMCA Batch Plant Operator/TDOT 2 & 3

NRMCA Pervious Installer Certification

NRMCA Certified Concrete Sales Professional

LAFARGE

and
Sustainability

Lafarge believes sustainability can be a competitive advantage. A member of the U.S. Green Building Council (USGBC), Lafarge works with other industry leaders to promote buildings that are environmentally responsible and healthy places to live and work.

Increasingly, Lafarge products, including our recycled content materials and blended cements, are playing a central role in sustainable architecture and construction — projects built under the Council's Leadership in Energy and Environmental Design Program (LEED).

We are proud to serve TN, KY, IN, IL, MO, AR and MS. For more information please contact the Mid-South Sales Office @ 1-800-707-0001 or visit us online at lafarge-na.com Thank you for your business!

CIM UPDATE

by Dr. Heather J. Brown

This summer, the Tennessee Concrete Association hosted 11 interns. Each of the interns learned many practical skills like pervious concrete placement, excavating and pouring footers, and how to perform different ASTM standards. The CIM program appreciates all the valuable opportunities TCA has provided our students. Here are a few comments from this summer's interns:

BRIAN ANDERSON —

"The TCA internship has proved to be very educational towards my future goals."

JASON CASTEEL —

"My internship with the Tennessee Concrete Association was one of the most influential and educational experiences in my life. TCA's intern program granted me the opportunity to gain valuable hands-on experience, while networking with many concrete industry professionals. I would like to thank Alan Sparkman and the entire TCA staff for allowing me to be a part of their summer intern program. All the industry professionals I met throughout the summer should not go unrecognized, as their expertise and advice will play a significant role in my future. The knowledge and hands-on experience I acquired will serve as a solid foundation for building and advancing my career in the concrete industry."

TROY OLIVER —

"It has been a great experience having an internship at the Tennessee Concrete Association. I have met great people and built great relationships within the industry through experiences offered at TCA—the opportunities for networking and for learning the skills we as future concrete managers need are endless. And my fellow interns are just as great. We've all shared some good times and endless laughs."

SCOTT SHAVER —

"Alan Sparkman has mentored me in concrete. I have experienced pouring, laying, mixing, and testing different forms of concrete. The best experience of my internship is getting up early and going to perform hard labor. Experiencing what the labor force deals with every day gives a different view of the industry than that I have learned within the program. Everything I have learned within the program has come to life with my internship. This has sparked my interest in concrete to a new level. My internship at TCA has influenced me to study what's going on in the industry today. Everything from the classroom has come to life under a mentor. The TCA is on the leading edge of Pervious concrete. Being a part of this is an experience that cannot be adapted to a classroom setting."

TIFFANY SIRIKOUN —

"I had limited knowledge and absolutely no experience in the concrete industry, but TCA has given me the opportunity to practice what I've learned in the classroom. Not only do I receive hands-on experience, but I also get to meet and network with influential people and learn about different trades in the industry. I love interning at TCA. It is an educational and enjoyable experience."

JOSH WILLIS —

"Since I have been at TCA I have had a chance to work with concrete in many different ways. Just this summer we have worked with a slab (driveway), pervious concrete (parking lot), flowable fill, and ICF's. I learned about all of these types of concrete in class, but TCA provided me with a great "hands on" work experience that really helped me visualize, apply, and better understand what I have learned in class."

"Supplying Tennessee with quality building materials for over 50 years."
