# THE FUTURE OF OUR INDUSTRY

Some questions asked during our summer meeting:

1. Where do you see the future of our industry five years from now?
2. What path will we take to accomplish these important things?
3. How will we know it is working?
4. What are we trying to accomplish as an organization?

**L**ife experiences have helped shape our industry and the success we have had in our industry. Many people in this industry, especially baby-boomers, are facing retirement from the concrete industry in the next five to ten years, and wondering, “What’s next?” At this year’s summer meeting, many questions were posed from the philosophical to the practical. I ask myself from time to time “will our personal views of life and our success remain constant throughout life?” This has made me think a lot about some interesting facts that were brought up at our summer meeting, as we went through a strategic planning session.

We were asked several different questions. One question that comes to mind was “Where do you see the future of our industry five years from now?” This question received many responses and made us all think about the future of our industry as we know it. We should ponder the same questions. We had several other questions that were asked. There were many answers and responses to these questions. Another great question that was asked was, “What path will we take to accomplish these important things?” There were many good answers to this question; but, the issue many had was dealing with our work force, our aging work force, from training to retaining good employees and drivers, to making life better for our work force. The last question that was asked, “How will we know it is working?” Many good answers were presented—from increased membership, increased involvement, to more total production, to a better public image, as well as a deeper/better industry product knowledge. Finally, “What are we trying to accomplish as an organization?”

Is the answer to these questions better education or reaching future concrete professionals at a younger age such as high school? Perhaps we need more education for trade schools in order to teach future finishers who will not be attending a college for whatever reason. We definitely need more customer education and a better industry image. I for one think we are doing a better job here than in the past, more industry networking, or more workshops, and train the trainer type sessions. One thing we all need to work on is

building industry relationships, whether it’s with other producers or contractors, it’s going to be vital to the future of this industry. I also think about our future leaders in this business, they are going to be the ones to have to step up and lead this industry in the future. Our future leaders may ask the same questions as well about what the future holds for them as we move forward.

These questions are significant in shaping our future. Early on in life most of us believe that success is all about the money and recognition and what’s the fastest way to get there. At some point in life, it seems to be a pivotal moment that sets us on the right path to be successful in the future. Once on that path how do we as an industry view our success? Success can change as people become more aware of changes and situations around them. A successful career is more one dimensional and more focused on reaching our goals as quickly as possible when we are youthful. Success in life also mirrors our being successful at our work as well. Trying to balance between our work and our personal life is a great challenge with the types of schedules that we keep in this industry, which makes our success in this industry all the more difficult.

All this being said, I think our summer meeting was a successful event. We left the event with many unanswered questions to think about for the future of this industry and where we might be headed in the future. Some of these same questions have been asked before, but still we struggle as an organization to answer them. It is kind of up to us as individuals to answer these questions in order to make our industry better. By helping each other to improve on our image and building better industry relationships and more political involvement, just maybe we can make a better future for the next generation. That next generation will shape our industry’s future. I don’t have the answers to these questions. But I do know that it will take all of us working together and putting our energy and time into this industry before we can make it a better organization. Our future depends on it. We need to act now to make these changes for the betterment of our future. We don’t need to wait five years. It might be too late if we refrain from action. ❖

TENNESSEE CONCRETE ASSOCIATION  
Providing Concrete Solutions for 25 years

**W**elcome to the 2012 Membership Directory issue of Tennessee Concrete magazine. I encourage you to keep this issue of our magazine handy so you can find a TCA member anytime you have a need related to concrete. Our membership directory is also available online at [www.tnconcrete.org](http://www.tnconcrete.org) and we have an additional contractor membership directory at [www.getconcrete.org](http://www.getconcrete.org). In addition to our printed and online directories, the TCA office recommends TCA members of all types nearly every day in response to phone calls and emails from potential concrete customers. Connecting members with customers is a key function for TCA, and a key benefit of TCA membership. Member support is what makes our existence possible, so I encourage you to support our members by utilizing their products and services.

TCA recently completed our annual strategic planning meeting and our focus this year was to identify the issues that will be shaping our industry over the next three to five years. Major areas of concern identified by the group included Image, Education, Advocacy, Workforce, Regionalization and Membership.

Three of the six listed areas are perennial ‘favorites’—image, education and advocacy have long been primary concerns of TCA’s membership. Industry image is about how we see ourselves as well as how others view our industry and image impacts all the other areas we identified. Likewise, education is a multi-faceted concern involving employees, customers and other influencers in the concrete industry. Advancing people’s knowledge of concrete will advance the utilization of concrete. Advocacy is primarily focused on the task of maintaining the concrete industry’s ability to operate within a reasonable regulatory and legal framework, as well as

communicating concrete’s many advantages for public infrastructure construction.

The other three areas identified in this year’s strategic process are not surprising, but they do seem to represent a shift in member’s thinking and priorities. Even with the slow (some would say ‘very slow’...) recovery in the construction industry ready mix producers are finding it very difficult to hire good candidates, especially drivers. That puts workforce concerns at the top of their list and this was reflected in our discussions. Regionalization identified the need for TCA to conduct programs at the local level so that members could have access to educational events and other association services, but a regional approach was also deemed very important to the success of TCA’s efforts in all the other areas. Also included in regionalization was a rekindled interest in the importance of networking with other concrete industry peers and this is best done on a face-to-face basis at the local level.

The fact that membership was identified as important for an association was certainly no surprise. Growing our membership base and retaining our current members is quite literally the foundation from which TCA operates, and expanding our membership will strengthen that foundation.

The TCA Board of Directors will be working to take us from the identification of these issues to a plan that will help us execute improvements in all six areas. A starting point for these efforts will be to engage more TCA members in the conversation by holding regional events across the state. Stay tuned for information about events to be held in your area, and please join your fellow TCA members to add your input and energy to our efforts to build a better and more effective association. ❖

# TCA Pervious Concrete Mixture

## Design and Adjustment Method Base on ASTM C 1688

### INTRODUCTION

Historically, pervious concrete mixture design in Tennessee has been based on experience. The most experienced person available was tasked with designing a mixture for a given situation. Field trials were commonly used to adjust the mixture to produce the desired properties. If the materials, compaction method used and properties desired were similar to previous jobs, the number of trials was usually small. However, if property requirements, materials, or compaction were significantly different from previous experience, the number of trials was increased. Typically, a small slab was placed (1 to 3 cubic yards), cores were taken and then sent off to be tested. Even if the number of trials was small, this process was expensive and time consuming. A short-cut mixture design procedure was badly needed to save time and money.

Tennessee Technological University (TTU) researchers, working in conjunction with Tennessee Concrete Association (TCA) have recently developed such a short-cut mixture design procedure. The goal of the procedure is not to eliminate field trials, which are good practice, but rather to minimize the number of field trials, saving both time and money expended to produce viable pervious concrete mixture designs. The method will be described and then supporting information will be presented. The central assumption in the method is that field engineering properties can be correlated with ASTM C 1688 voids (1).

### TCA PERVIOUS CONCRETE MIXTURE DESIGN STEPS

#### STEP 1: SELECT AGGREGATE(S)

Select a coarse aggregate for the mixture. TCA recommends ASTM C 33 (2) No. 8, No. 89 or similar. A fine aggregate may also be selected for the mixture. TCA researchers have used both river sand and manufactured limestone sand in pervious concrete. Crouch, Williams, and Badoe provide extensive guidance on fine aggregate advantages and disadvantages in Tennessee Concrete Summer/Fall 2011 (3). Information on gradation, specific gravity and absorption is required for each aggregate selected. The factors controlling aggregate selection are primarily availability and cost. Aggregate properties, particularly gradation and shape, have a tremendous impact on cementing materials content and compaction.

#### STEP 2: SELECT PERCENTAGE OF FINE AGGREGATE BY TOTAL AGGREGATE VOLUME

TCA recommends that designers keep the  $d_{10}$  of the combined aggregate gradation greater than or equal to 2-mm. The  $d_{10}$ , or effective grain size, of the combined aggregate gradation can be determined by mathematically blending the aggregates and then plotting the combined aggregate gradation. TCA currently recommends that designers not use more than 10 percent fine aggregate by total aggregate volume.

#### STEP 3: SELECT CEMENTING MATERIALS

TCA recommends Type I or Type II portland cement meeting ASTM C 150 (4) and supplementary cementing materials (SCM) may also be used. Extensive guidance on SCM advantages and disadvantages can be found in Tennessee Concrete Summer/Fall 2010 (5) and Green<sup>2</sup>: High Volume Slag Substitution in Pervious Concrete (6).

#### STEP 4: SELECT CHEMICAL ADMIXTURES

Chemical admixtures are optional, but are very beneficial in the opinion of the authors. TCA recommends a mid-range water reducer, a hydration stabilizer and a viscosity modifier be used in cases of typical light compaction. Crouch provides extensive guidance on fine chemical admixture advantages and disadvantages in Tennessee Concrete Winter 2010 (7).

#### STEP 5: BEGIN WITH A STANDARD MIXTURE OR A PREVIOUS MIXTURE BASED ON EXPERIENCE

TCA recommends starting with a maximum 600-lbs/CY of total cementing materials, 180-lbs/CY of water, assuming 20 percent voids, and a total aggregate absolute volume calculated to produce 27 cubic feet of total volume for a mixture that will experience the light compaction common in Tennessee (see Figure 1). However, if a previous mixture is available from a similar situation it should be used as the beginning point.

#### STEP 6: PRODUCE A BATCH OF THE MIXTURE IN THE LAB AND CONDUCT ASTM C 1688

TCA recommends that the exact materials planned for the job also be used in the pervious lab mixture. Figure 2 shows former graduate student Martin L. Medley preparing for a small laboratory batch. Figure 3 shows Medley determining the mass of the

Figure 1: Light Compaction Typical for Pervious Concrete in Tennessee

Figure 4: Preparing a Small Laboratory Batch for ASTM C 1688

by L. K. Couch, Martin L Medley, John Hendrix and Alan Sparkman

# TCA Pervious Concrete Mixture

## Design and Adjustment Method Base on ASTM C 1688

measure to be used for ASTM C 1688. Figure 4 shows former graduate student John Hendrix conducting ASTM C 1688 on a laboratory batch of pervious concrete.

### STEP 7: ADJUST PASTE VOLUME

If actual ASTM C 1688 voids are higher than target voids, the paste volume should be increased and total aggregate absolute volume should be decreased while still maintaining 27-cubic feet. Similarly, if actual ASTM C 1688 voids are lower than target voids, the paste volume should be decreased and total aggregate absolute volume should be increased while still maintaining 27-cubic feet. Paste volume can be increased or decreased using water-to-cementing materials ratio (w/cm) or cementing materials at a constant w/cm. Figures 5 and 6 show the effects of w/cm and total cementing materials weight on ASTM C 1688 voids, respectively. More information on target void values will be provided later in the paper.

### STEP 8: ITERATE TO CONVERGENCE

Repeat Steps 6, 7 and 8 until actual ASTM C 1688 voids converge upon target voids. It is important to note that Steps 6, 7 and 8 can stand alone as a pervious concrete mixture adjustment method.

### STEP 9: FIELD TRIAL

TCA recommends that after the mixture has been adjusted to significant convergence with the target voids, the final mixture should be field placed, cored and tested as there is no substitute for field placement. The purpose of the TCA mix design and adjustment method is not to eliminate field trials, but rather to reduce the number of field trials required to develop a pervious concrete mixture and their associated expense and delay.

## RESEARCH TO SUPPORT THE TCA MIX DESIGN AND ADJUSTMENT METHOD

### MEDLEY'S WORK

Medley worked with several typical Tennessee limestone coarse aggregate and fine aggregate combinations (see Figures 3 and 4). Fine aggregate percentages were chosen in order to produce  $d_{10}$  values of approximately 2-mm. Mixtures were designed at various different total cementing materials values and w/cm ratios. A batch of each mixture was produced and ASTM C 1688 was conducted on the pervious concrete. A 6x6x24-inch

beam was also fabricated from each batch. The researchers attempted to model the light compaction common in Tennessee (see Figures 1 and 7) and therefore only two passes of a light roller fabricated from a 6x12-inch concrete cylinder were used to compact the beams. The beam was cured for 24-hours in the mold. Subsequently the mold was removed and the beam was cured by limewater immersion until coring at 7 to 10 days after casting. Four cores were cut from each beam (see Figure 8). Two cores were used for ASTM D 7063 Effective Voids (8). The remaining two cores were sulfur-capped as per ASTM C 617 (9) and tested for compressive strength as per ASTM C 39 (10) at 28-days. Medley's work (11) showed good relationships between ASTM C 1688 plastic voids and ASTM D 7063 hardened effective voids (see Figure 9) and core compressive strength (see Figure 10).

### HENDRIX'S WORK

Hendrix (12) worked with one limestone coarse aggregate and fine aggregate combination using the adjustment portion of the method. Hendrix attempted to maximize the compressive strength of a typical pervious mixture while maintaining constant head permeability greater than 100-inches/hour and a combined aggregate gradation  $d_{10}$  of approximately 2-mm. The beginning control mixture had 600-lbs/CY of cementing materials with a 0.3 w/cm ratio, 2584-lbs/CY of No. 89 limestone coarse aggregate and no fine aggregate. Twenty replications of the control mixture yielded average ASTM C 1688 voids, 28-day compressive strengths, and constant head permeabilities (13) of 19.4 percent, 2080-psi and 440-inches/hour, respectively.

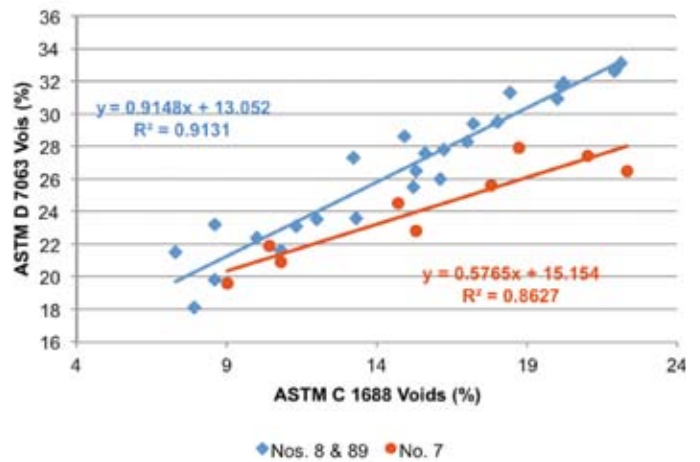

Guidance from previous unpublished work showed that for the desired permeability, ASTM C 1688 voids should be approximately 15 percent. Hendrix first attempted to decrease ASTM C 1688 voids by increasing the w/cm to 0.308 and including 3.5 percent river sand by total aggregate volume. Coarse aggregate content was reduced to accommodate these changes. Twenty replications of this first attempt at adjusting the mixture yielded average ASTM C 1688 voids, 28-day compressive strengths and constant head permeabilities of 17.6 percent, 2348-psi, and 294-inches/hour, respectively. Although the first attempt improved the mixture, a second attempt was made to maximize compressive strength.

Hendrix's second attempt further reduced the ASTM C 1688 voids by including 7 percent river sand in the combined aggregate gradation and increasing the w/cm ratio to 0.315. Coarse aggregate content was again reduced to accommodate the changes. Twenty replications of the second modified mixture yielded

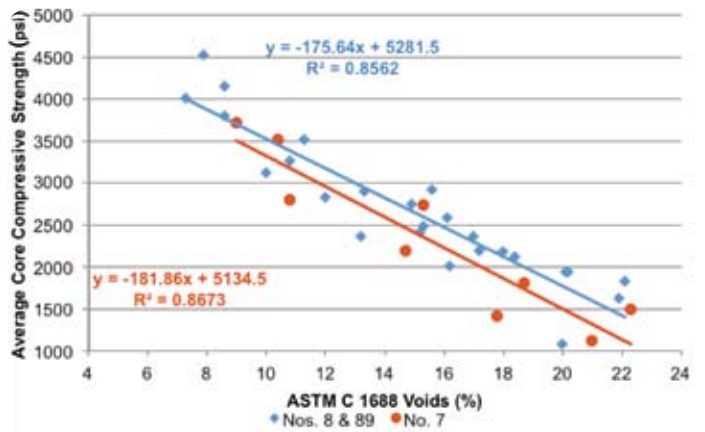

**Figure 7: Compacting a Beam with a 6x12-inch Concrete Cylinder Roller**

**Figure 9: Hardened Voids (ASTM D 7063) vs. Plastic Voids (ASTM C 1688)**

**Figure 8: Cored Pervious Concrete Beam and Four Cores**

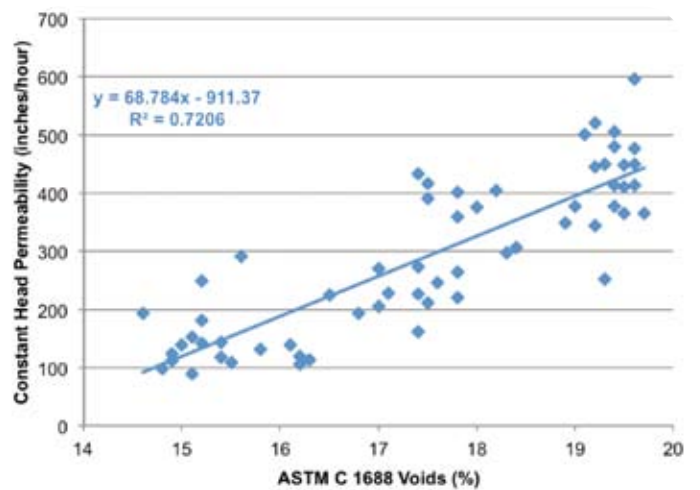

**Figure 10: Core Compressive Strength (ASTM C 39) vs. Plastic Voids (ASTM C 1688)**

average ASTM C 1688 voids, 28-day compressive strength and constant head permeabilities of 15.5 percent, 2630-psi and 155-inches/hour, respectively. The 26.4 percent increase in compressive strength over the control appears very promising for the TCA Mixture Adjustment Method. Figure 11 below shows permeability values generated by Hendrix.

### CLOSING REMARKS AND CAUTIONS

The target ASTM C 1688 voids of approximately 15 percent for 100-inches/hour laboratory constant head permeability are only for No. 8, No. 89 or similar limestone coarse aggregates with less than 10 percent fine aggregate by total aggregate volume. The ASTM C 1688 target voids are also only for the light compaction described in this paper. Other materials or compaction techniques will undoubtedly result in different target ASTM C 1688 void contents. In general, lower ASTM C 1688 voids will increase compressive strength and reduce permeability. However,

**Figure 11: Constant Head Permeability vs. Plastic Voids (ASTM C 1688)**

by L. K. Couch, Martin L Medley, John Hendrix and Alan Sparkman

# TCA Pervious Concrete Mixture

## Design and Adjustment Method Base on ASTM C 1688

ready-mix producer designers should build their own databases over time for their materials and compaction techniques. TCA recommends that all pervious concrete mixtures be field tested prior to use in an actual job.

NRMCA Certified Pervious Concrete  
Installer

The Wildcat Roller Screed is the easiest to use on the market and the most economical. It is also an ideal tool for concrete sidewalks, walking trails and golf cart paths.

We welcome comparison to any other brands.

## TCA Services & STAFF

The Tennessee Concrete Association (TCA) was founded in 1986 to promote the increased use of ready mixed concrete in Tennessee. Our mission statement is: "The TCA is the unified voice for the concrete industry to improve our image and awareness through advocacy, promotion and education that support our members, our community, and our future." We work to fulfill this mission in all of our activities. We invite you to join us in building a concrete industry we can all be proud of.

Supported primarily by membership dues, the association is governed by a 15 member board of directors elected annually by members. The board includes 10 ready mixed producer members who direct local promotional programs in each of our three regions.

## Association STAFF

**Alan Sparkman**  
Executive Director

**Darla Sparkman**  
Office Administrator/Certifications

**Sarah Egan**  
Director of Communications

**Bernadine Hughes**  
Bookkeeper

## 2012 TCA PROGRAMS

### Promotion

**Annual Convention** – This event brings all members together to celebrate the year's accomplishments.

**Concrete Conference** – Held each year to update architects & engineers on current concrete practices.

**Tennessee Concrete Magazine** – Published 3-4 times annually.

**Membership Directory** – Published annually with information advertising your company.

**E-Newsletter** – To keep you informed of Association programs, industry activities and promotional events.

**Concrete Excellence Awards** – Design Construction and Environmental awards.

**Product Demonstrations** – Decorative, Pervious, Insulated Concrete Forms, Ultra-thin Whitetopping, & Flowable Fill.

**Literature Development** – Statewide High School Concrete Essay Contest.

**Product Promotion Kits** – Kits available for sales helps.

**Trade & Home Show Displays**

**TCA Website** – [www.tnconcrete.org](http://www.tnconcrete.org) and the Intranet for up-to-the minute calendar events.

**Video & Technical/Promotional Literature Library** – Maintained as a members resource.

### Training and Certification

ACI Field Testing Technician, Grade 1

ACI Flatwork Finisher & Technician

ACI Concrete Laboratory Testing Technician Grade 1 & 2

ACI Concrete Construction Special Inspector

ACI Concrete Strength Testing Technician

NRMCA Certified Driver Training

NRMCA Certified Concrete Production Technologist

NRMCA Batch Plant Operator/TDOT 2 & 3

NRMCA Pervious Installer Certification

NRMCA Certified Concrete Sales Professional

## Past TCA PRESIDENTS

# CIM UPDATE

by Dr. Heather J. Brown

MTSU President Dr. Sidney A. McPhee, left, is shown with 10 of 13 students who received funding for summer internships with local construction and concrete businesses across the region. Also pictured (from left) are Cory Powell of Lawrenceburg, Tenn., Billy Mitchell of Memphis, Nathan Tenpenny of Murfreesboro, Cameron Robinson of Memphis, Ryan Jessie of Murfreesboro, David Dozier of Gallatin, Richard Nelson and Cameron McKee of Murfreesboro, Dan Erickson of Pekin, Ill., Jim Duffy of Murfreesboro, Dr. Pat Geho of the Tennessee Small Business Development Center and Dr. Heather Brown of CIM.

**W**ith the help of state funding, 13 out of nearly 50 students in the Concrete Industry Management department at Middle Tennessee State University will work paid internships this summer that will prove valuable once they enter the job market. The CIM chair said the department relies on industry support each year to place the summer interns.

Companies have had to tighten budgets and in many cases suspended paid internship programs across the country, said Dr. Heather Brown, MTSU concrete industry chair. CIM students are required to work in the industry up to 400 hours, which has proven valuable in full time career placement, she added.

Although the job outlook has improved this year, students still struggle to find summer jobs on their own, Brown said.

This year CIM received \$41,983 in funding from the Tennessee Small Business Development Center to provide students with paid internships, Brown said, adding that these student internships are with small businesses in the concrete and construction industries across the Midstate.

“All of the companies that were awarded a ‘free’ summer intern give to the CIM program in many ways through time, talent and treasure,” Brown said. “We wanted to reward the generosity of our supporters in the concrete and construction industry and give back to companies who typically cannot hire paid interns.”

“CIM is also grateful to have placed these 13 students in sum-

mer employment as a result of the funding provided by Dr. Sidney McPhee, MTSU’s president, and Dr. Patrick Geho, state executive director of the University’s Tennessee Small Business Development Center program,” Brown added.

The Tennessee Small Business Development Center is a network of professional business consultants with 14 centers and five affiliate offices throughout the state. The center provides expert business advice to all types of businesses, whether a manufacturer, retailer, service provider or a professional.

Locally, the Tennessee Small Business Development Center at MTSU is located inside the Rutherford County Chamber of Commerce, 3050 Medical Center Parkway in Murfreesboro. ❖
